Physical/political shaded aid maps Satellite image Drawn Landform Climate Average Temperature Cumulative Rainfall Culture Density Aboriginal Tribes Natural Gas DryNess SaltNess Koeppen Climate Vegetation Other is a political map showing individual states of Australia, as well as marking the reservoirs surrounding the continent. There are also city names, land names, and various rivers in Australia. Notice how the most cities along the coast, especially on the east coast including the major cities of Brisbane, Sydney and Melbourne. (This shaded relief map shows the relief forms of Australia as well as the political aspects of the country, such as state and city names. Legend also points out that means of transport like roads and railways are also present. The presence of parts of Indonesia and Papua New Guinea gives some relevance to the places where the country is located in the world. Latitude and longitude lines also indicate where Australia is in the world. The only real drawback of this map is the fact that some of the type is small. (Satellites have helped the world with mapping, and this map is made from satellite images. The borders are Papua to show states and cities easy to decipher with great font. The reservoirs are also clearly marked, but the latitude and longitude lines cannot really be read. The roads on this map are also drawn in inches (This is another form of physical map, except for all forms of land colored and drawn in. Although there is no legend on this map to distinguish landscape types, they can be identified by reading the map. Dark green is a mountain range, light green means lowlands, and tan colors represent deserts. (Climate Average Temperature for 2006 can be easily seen on this map. The colors can be easily seen and you can tell that they are a legible key on the right side of the card. Coastal areas seem to be cooler all year round, and the interior is warmer due to the deserts that lie within the country, as seen on physical maps. (This map of the Australian government shows the average rainfall for part of June 2004. As on the map above, the legend on the right side of the map clearly shows the amount of precipitation for the designated period of time. Since the seasons are drawn Australian in the southern hemisphere, the current month is in the rainy season. (Culture is a population density map for Australia. This map clearly shows that coastal areas are more populated than inland areas. There are even parts around the deserts that are 0 to 0.1 people for every 2.5 square miles indicated a place where no one lives. Large cities stand out red dots that appear on the east and west side of the country. Cities that stand out Perth on the west coast, and Melbourne, Sydney and Brisbane in the east from south to north. (This map shows the Aboriginal tribes that existed in Australia in 1836 and their places. The downside of this card is the small type that appears here. This map was based on an atlas of the Australian government that is full of various historical and physical maps. The Australian was first discovered in 1606, but was not colonized until 1788. Around the time of this map, 1836, states began to emerge as individual colonies and Aboriginal populations began to decline. (I don't Natural This map shows the location of natural gas in the country. Note along the north and west coasts that there is the presence of offshore drilling. It is also present in Melbourne's south-east. Another thing that is present is the location of the pipelines. Another matter is the percentage of natural gas the area produces is labeled near the region. More than half of the natural gas is sourced from the Carnarvon Basin on the west coast north of Perth. (This interesting map shows how much salt is in the ground according to this dry salinity risk map. Even if the numbers are not assigned to show how much salt is in the soil, the colors show different amounts clearly. In the south, there seems to be a serious problem with salty land, but desert areas do not. This may be due to the fact that the interior does not border the ocean, which can be a huge factor. (File:map1.gif) This is a useful map to really see Australia's climatic regions. This map shows the various Koeppen climate systems that exist in this country. The legend on the right labels of different types and colors is easy to see. This map also details the seasonal conditions that really distinguish climates. (Other This interesting map shows how big Australia is in relation to Map is older with countries such as Yugoslavia, and Czechoslovakia, and even even The USSR, but since then the land has not changed dramatically, so the map is still good. This map is just good to look to get an idea of how big Australia is compared to the rest of the world. (Presented by Mike Golka, Kamren LeFlore, Frank Hebert, Andrew Trent, and Charles quigley on April 22, 2007.
