Breasts consist of four main tissue structures: adipose tissue, milk ducts, glands and connective tissue. The thick (fat) tissue is prone to fluctuations in the volume of the liquid. This can cause your breasts to swell, resulting in soreness or tenderness. Other changes in breast tissue can also lead to swelling of the breast. Swelling of the breast can cause noticeable changes. For example, your breasts may become noticeably larger. The veins in your chest may become more noticeable as the swelling brings them closer to your skin. Other symptoms may include: feeling heavy in the chest or discomfort around the chest and possibly in the armpits changing to the texture of the breast or skin on and around the breast. In some cases, your breasts will feel warmer or hot to the touch. Solid lumps in breast tissue can also accompany breast swelling. While this is not always a cause for concern, it can be a sign of breast cancer. A variety of things can cause swelling of the chest. Causes range from harmless to serious. Premenstrual syndrome (PMS) is one of the common causes of breast swelling. Before each period, estrogen production increases. Along with other changes in your body, this hormonal shift can lead to an increase in the ducts and breasts. It can also cause water retention, which can increase breast swelling. Symptoms associated with PMS tend to improve when you start your period. Breast swelling can also be a symptom of breast cancer. There are different types of breast cancer. Inflammatory breast cancer can cause your breasts to swell as a result of blocked lymph vessels. Your breast tissue may also appear pitted like an orange peel. Tumors in the chest can manifest as stiff and painful lumps. Other potential causes of breast swelling include: food and beverages, such as those with a lot of caffeine or salt, certain medications, such as birth control pills that contain estrogen, changes, which occur when you are pregnant after part of the related changes that occur after you have given birth, mastitis, an infection of your milk ducts that can occur with breastfeeding, breast diseases, a condition in which you develop non-cancerous lumps in the breast but it shouldn't become so uncomfortable that it disrupts your daily life. If you experience excessively painful swelling of the breast during the menstrual cycle, make an appointment with your doctor. You should also talk to your doctor if you experience swelling of the breast, which is accompanied by any of the following symptoms: crack your nipple, changes in the color of the nipple or skin on the chest or puckering the skin on the chest, swelling of the breast, which prevents breast milk from coming out, giving birth to a hardened lump in breast tissue that does not change during the menstrual cycle, cycle your breasts that are not healing, unexpected discharge from the nipple, if you experience other symptoms that are not better with time, talk to your doctor. If in doubt, ask them about your symptoms. To diagnose the cause of breast swelling, your doctor ask you questions about your symptoms. For example, they may ask when your symptoms started and whether they are better or worse at a certain time. They will also study your breast tissue and feel to pieces. They may recommend imaging tests such as mammograms or breast ultrasound to view the internal structures of your breasts. Your doctor's recommended treatment plan will depend on the cause of breast swelling. If the tumor is caused by an infection, they can prescribe antibiotics. You can also learn how to keep your breast tissue clean and dry to prevent further infection. If the tumor is caused by hormonal changes associated with the menstrual cycle, your doctor may prescribe birth control pills that can relieve breast swelling and other PMS symptoms in some women. If you are already using hormonal contraceptives, they may encourage you to switch to a different type. If you are diagnosed with breast cancer, your recommended treatment plan will depend on the type, location and stage of the cancer. They may prescribe chemotherapy, radiation therapy, surgery or combination. Here are some tips for relieving the discomfort associated with breast swelling. Wear a supportive bra or make sure your bra fits properly. Apply a cloth-covered heat pack or ice pack to the chest for up to 10 minutes. Use trouble-free painkillers such as ibuprofen (Advil). Shop online to support bras. Since breast swelling is sometimes a sign of breast cancer, regular mammograms are recommended for women 45 years and older. The American Cancer Society recommends the following screening guidelines for women: Age 40-44: Start annual mammogram screenings if they choose to do so. Age 45-54: Get an annual mammogram. Age 55 and older: mammogram every two years, or annually if a woman prefers. All women should be familiar with how their breasts feel normal and talk to their doctor if any changes occur. In some cases, eating a healthy diet reduces the pain and tenderness associated with breast swelling. Try to eat lots of fruits and vegetables and avoid processed foods and those rich in saturated fats. Consider reducing caffeine consumption by limiting your consumption of fizzy drinks, coffee and tea. Reducing salt intake and increasing water intake can also help ease bloating. Medical Review by Elaine C. Luo, M.D. - Author Kahn - Updated April 4, 2019 Understanding facial tumor You may sometimes wake up with a swollen, swollen face. This can occur as a result of the pressure exerted on your face during sleep. However, the swollen, swollen face of the face also occur due to facial injury or indicate a major disease. Facial swelling not only involves the face, but it can also include the neck or throat. If there are no facial injuries, swelling of the face may indicate emergency medical care. In most cases, the health care provider must treat swelling of the face. Several conditions can cause swelling of the face. Here's a list of 10 possible reasons. Warning: Graphic images ahead. Allergic conjunctivitis Sher on Pinterest This eye inflammation is caused by an allergic reaction to substances such as pet dander, dust, pollen, or mold spores. Red, itchy, watery, swollen, and burning eye symptoms. These eye symptoms can occur in conjunction with sneezing, runny nose, and

itchy nose. Read the full article on allergic conjunctivitis. PreeclampsiaShare on PinterestIt condition is considered a medical emergency. Urgent help may be required. Pre-eclampsia occurs when a pregnant woman has high blood pressure and possibly protein in her urine. This usually occurs after 20 weeks of pregnancy, but can occur in some cases early in pregnancy, or even after childbirth. This can lead to serious complications such as dangerously high blood pressure, seizures, kidney damage, liver damage, fluid in the lungs, and blood clotting problems. It can be diagnosed and managed during regular antenatal care. The recommended treatment for symptom resolution is the delivery of the baby and the placenta. Doctors will discuss the risks and benefits of delivery, depending on the severity of symptoms and the gestational age of the child. Symptoms include persistent headache, vision changes, pain in the upper abdomen, pain below the sternum, shortness of breath, and changes in mental state. Read the full article on pre-eclampsia. Cellulite Share on PinterestIt condition is considered a medical emergency. Urgent help may be required. Caused by bacteria or fungi entering through a crack or cut into skinRed, painful, swollen skin with or without oozing, that spreads quicklyHot and tender touchFever, chills, and red stripes from the rash can be a sign of a serious infection requiring medical attention Read the full article about cellulite. The rapid onset of symptoms occurs after contact with the allergen. These include widespread hives, itching, swelling, low blood pressure, shortness of breath, fainting, rapid heart. Nausea, vomiting, diarrhea, abdominal pain are additional symptoms. Read the full article on anaphylaxis. Allergy to Drugs On PinterestThis condition is considered a medical emergency. Emergency services can be Itching, red rash can occur from a few days to several weeks after taking the drug allergy can be life-threatening and symptoms include hives, racing heart, swelling, itching, and difficulty breathingCurrent symptoms fever, indigestion, and tiny purple or red dots on the skin Read the full article about drug allergies. AngioedemaShare on PinterestThis is a form of strong swelling beneath the surface of the skin. It can be accompanied by hives and itching. It is caused by an allergic reaction to an allergen like food or medication. Additional symptoms may include abdominal cramps and discolored spots or rashes on the arms, arms and legs. Read the full article on angioedema. ActinomycosisShare on PinterestThis long-term bacterial infection causes ulcers, or abscesses, in the body's soft tissues. Dental infections or injuries to the face or mouth can lead to bacterial intrusion into the face or intestines. The overload under the skin first appears as a reddish or bluish area. Chronic, slow-growing, non-public mass becomes aussie with patches of thick, yellow, drainage fluid. Read the full article on actinomycosis. Broken noseShare on PinterestA break or crack in the bone or cartilage of the nose, it is most often caused by injury or exposure to the face. Symptoms include ain in or around the nose, curved or crooked nose, swelling around the nose, bleeding from the nose, and rubbing or grating sound or feeling when the nose moves or rubbed. Bruises can occur around the nose and eyes, which dissipate a few days after the injury. Read the full article about the broken nose. The outer eyelid styeShare on PinterestBacteria or blockage in the oil glands of the eyelids causes most eyelid strokes. These red or skin-colored lumps usually occur along the edge of the eyelid. Red, watery eyes, sandy, prickly sensation in the eyes, and sensitivity to light are other possible symptoms. Most eyelid bumps are mild or harmless, but some may indicate a more serious condition. Read the full article on the outer age of stye. Sinusitis Isnusitis is a condition caused by inflammation or infection of the nasal passages and sinuses. This may be due to viruses, bacteria or allergies. The severity and duration of symptoms depends on the cause of infection. Symptoms include decreased sense of smell, fever, stuffy nose, headache (from sinus pressure or tension), fatigue, sore throat, runny nose, or cough. Read the full article about sinusitis. A swollen face due to an allergic reaction may be accompanied by other symptoms. These are symptoms of anaphylaxis, a serious allergic reaction. Proper medical treatment should be administered immediately to prevent the reaction from turning into anaphylactic shock. Anaphylactic shock can be fatal. Symptoms of anaphylaxis and anaphylactic shock include: swollen mouth and throatdifficulty breathing or swallowing or rash on the face or limbsanxiety or confusion or wheezingdizziness or lightheadednessnasal congestionpalpitations and irregular SpeechIf you experience any symptoms of anaphylaxis, call 911 Symptoms of shock can set in quickly. Quickly. Symptoms include: rapid breathing of heart rate rapes pulsed blood pressureIn severe cases, respiratory or cardiac stops may occur.Common causes of allergic reactions are allergens such as: Call 911 or local emergency services immediately if you: eat foods that you are allergic tobeen exposed to the famous allergenbeen stung by poisonous insects or reptiles Do not wait for symptoms. These symptoms may not occur immediately, although they do in most cases. Along with facial swelling, other symptoms may occur, including: hives or rash congestionwatery eyesdizzinessdiarrhea breasts discomfortstom discomfortweaknessswelling surrounding your health care provider immediately if you have swelling of the face. Swelling caused by a bee stingIf a nursery bee sting caused swelling, immediately remove the stinger. Do not use tweezers to remove the stinger. The tweezers can pinch the stinger, causing it to release more poison. Instead, use a playing card: click down on the skin before the stinging Gently move the card to the sting. Scoop the sting out of the skin. Swelling caused by an infectionIf the tumor was caused by an infection in the eyes, nose or mouth, you are likely to be prescribed antibiotics to clean it. If an abscess is present, your doctor may open the abscess and drain it. The open area will be closed with packaging materials to keep it from infestation and recurrence. A soothing rash rash can be soothed without a prescription (OTC) hydrocortisone cream or ointment. Using a cool compress can also soothe the itching. Other causes, such as fluid retention and underlying diseases, will be treated by a doctor accordingly. Prevent swelling of the face by avoiding known allergens. Read the ingredients labels and, having dinner, ask your waiter what ingredients in the dishes you order. If you have a known allergy that can cause anaphylaxis and have been prescribed epinephrine medications such as EpiPen, be sure to carry it with you. This medication is used to counteract severe allergic reactions and can prevent swelling of the face. If you have had an allergic reaction to medication, do not take this medication again. Tell your doctor about any reactions you have experienced after taking medication or eating certain foods. Last medical review April 24, 2018
