Although the Google Play Store has over a million apps that you can install on an Android device, the market sometimes removes popular software from its catalog such as Grooveshark Mobile and Adobe Flash Player. However, you don't have to download apps only from the official market: You can set up your device to download installation packages or APK files from elsewhere. To download a package from an email app and install it on Android, you need to download and use a third-party program. Open The Settings from the app screen or notification bar, and then tap Security. Scroll down to the device's administration and then check the Unknown Sources option. Download the attachment from your email app or mobile browser, and then open the Google Play Store from the Home or Apps screen. Search and then install Apk Installer Graphilos Studio from the Play Store. Open the app to complete the installation, and then review the folder containing the downloaded package. Select the APK file from the file manager, and then tap the Package Installer to start the setup. Follow the tips on the screen to install APK content on your smartphone. Open The Settings from the app screen or notification bar, and then tap Security. Scroll down to the device's administration and then check the Unknown Sources option. Download the attachment from your email app or mobile browser, and then open the Google Play Store from the Home or Apps screen. Search and then install Apk Installer by Array Infotech from the Play Store. Open the app when the installation is complete and then select the appropriate package from the list. Tap Set and then touch installing packages from a pop-up. Follow the tips on the screen to install THE APK on the device. Open The Settings from the app screen or notification bar, and then tap Security. Scroll down to the device's administration and then check the Unknown Sources option. Download the attachment from your email app or mobile browser, and then open the Google Play Store from the Home or Apps screen. Search and then install Easy Installer from the Play Store. Open the app when the installation is complete, and then select the corresponding package from the list. Tap Set and then touch installing packages from a pop-up. Follow the APK on the device. The default source for Android 4.x apps is the Google Play Store, but Google restricts apps to certain phones based on location and known compatibility. In addition, some developers do not offer their apps in the Google Play Store and require you to manually download the Android Package (APK). Once the APK file is on your phone, transfer it to your phone to manually install the app using the Android App App. Insert the smaller end of your Android's USB cable in port on your Android phone. Connect the other end of the USB charging cable to a standard USB port on your computer. Click Start and then click Windows Explorer. Double-click your Android phone from the Portable Devices section and then tap the SD Card button to access your phone's memory card. Drag and drop APK files anywhere on the SD map to move them. Click on the USB icon in the Windows 7 notification area and select Eject your android device before disabling the cable. If you don't see the USB icon, click on the small arrow to the left of the notification area. Android: Root Uninstaller is an Android phone utility that lets you remove multiple apps from your phone at the same time, freeze pre-installed apps to free up space and resources, and even create APKs from pre-installed apps so you can install them on a new phone. Root Uninstaller isn't as reliable as the previously mentioned titanium backup when it comes to backing up and saving all your apps, settings, and data. However, one thing it does that Titan doesn't do is create APKs from already installed applications. If you have a new Android device and your favorite app is no longer on the market - a situation that happened to me just last week - the app allows you to create APK from apps installed on your device, save them on an SD card (where it can be moved to Dropbox, for example) and re-install the app on another Android device. In the ideal world of your Android app, their settings and system settings... MoreY Android device should not be rooted if all you want to do is save, create and manage APKs or package remove apps. It must be rooted in order to remove system applications, freeze or freeze system applications, remove system applications, and more. Root Uninstaller Free gives you all of these features, but it limits you to three freeze/thaw operations, and this stops you from restoring app backups through the app. The pro version opens up these features and will set you back just over \$2 USD. Root Unicorn Android Market via Addictive Tips You can contact Alan Henry, author of this post, on alan@lifehacker.com, or better yet, follow him on Twitter or Google+. There are dozens of dialer replacements for Android, and many of them do the same. Some of them are free, some are worth the money, all of them basically duplicate the functionality you already have on your phone. Even so, we believe that Dialer One is the best speed set, which is based on the stock set function without requiring you to give up a ton of money or a bunch of plugins to make the tool work for you. Dialer One Platform: Android Price: Free download of PageFeaturesDial number usually, dial speed by assigning contacts to numbers on the keyboard, or using T9. Search the number when dialing so you can enter multiple numbers and then choose from the right correctly for contacts by partial name as well, so you can quickly find and call someone by typing in a nickname, surname, or part of their name Supports contact groups for an easy organization, and can search within or through groups Automatically connects to and organizes your Google contacts after installing Public SMS and email by long-term contact clicking, as well as send contact to transfer contact information to someone else, outgoing, missed, answered, and voice calls, or set up your own call filter Hide it Excludes Dialer One is not, by any means, the only set for Android. We'll get alternatives in a minute, but before that, the biggest reason that Dialer One is our choice, in addition to what we've mentioned before, is that it's simple, elegant, free, and combines the best features of other high-speed setters together in one app that covers all bases without being on top. People familiar with how you used to be able to dial-you know before all were smartphones where you could just long click on the number on the keyboard and speed-dial the person in your contact list in this slot will appreciate the fact that Dialer One lets you do just that. Organizational fans will love its ability to organize your contacts, and the fact that it automatically organizes your contacts by category and by organization as soon as you download and install the app. Android: If the default Android dialer feels too naked for you, dialer replacement Dialer One... More People who love T9, never remember their contacts full names or numbers, or just love finding contacts - either with a keyboard or keyboard-appreciate Dialer One flexibility, and the fact that you can do any of these things. Start entering numbers and the app will make suggestions. The letters will be read, and the app will do the same. It doesn't matter and you don't need to set up an app to make any of it. You can, however, dig through the settings and really customize the app the way you like. The app settings and settings are deep once you start digging into them, but all the important features ahead for you to use. Where it drops is the only thing about Dialer One that could use a little help interface. It's clean and well laid out, and the ability to swipe from screen to screen is great, but it's not the most beautiful or most tweakable dialer we've seen. However, we don't really complain about this - the app is free, after all, and the feature far outweighs the form here. Competition there are so many alternatives and other sets for Android that there is no way we can cover them all. However, a few that especially GO Contacts (free), which is extremely popular and incredibly customizable and tweakable. We mentioned it last week. contender for best address book, but it's really more of a replacement set. These search tools are strong, it has great localization options, and tons of skins, plugins and other add-ons that can be downloaded as separate add-ons. Even so, in our testing GO Contacts was a great choice if we really wanted a thematic, attractive user interface, especially for text messages, but that's about it. However, it takes the approach to be lean and mean and then make you download the add-on to get the features you want. It's tricky, but it's functional once you set it up, it's reliable as well. You just spend some time setting it up as you like. If you're looking for a smarter, more organized, and just all-around better way to manage your bunch of More For those people who really need multilingual support, or really like the MIUI set, try exDialer (free), which also supports T9 and partial contact search. The app sets up its own contact manager as well, which you can use if you prefer, but the set itself is lean, fast, and if all you need is a T9 and a partial search, that's all you need. You don't get organizational tools or speed dial features, but that's a good option. Similarly, TouchPal Dialer uses a different approach, and offers a dialpad speed feature that Dialer One offers and some of the partial contact search, but saves on T9 (or at least we couldn't make it work well.) However, for international subscribers and people who need multiple languages, it's worth a look. If all you need is a dialpad high-speed dialpad, try the Speed Dial classic. It's simple, free, and all it does is give you a list that you can assign contacts, 0-9, and when you long click that contact number, it will dial them. That makes it for all free apps. There are some inventive kits on the market that cost money though, although not much if you're willing to give up the dollar and make the most of your conversation in the car, take a look at the Tap Dialer (\$1), which allows you to set your usual dialed contacts with numbers that you physically tap on the screen to dial. For example, if I'm number 4 on your list, all you have to do is run the app and then tap the screen four times to automatically dial my number. Even if you still have to look at the screen to run the app, it's a good in the right direction for loud subscribers. The same applies to the sign (\$4, \$2 for a limited time), which replaces the taps with painted patterns on the screen. Start the app, draw a template, and the finder will start and call your contact. Finally, don't lose sight of the built-in stock dialer. It's not great, and it definitely varies from phone to phone, but none of the apps above do some of the basics that are all all Sets do like give you the ability to create home screen widgets of your favorite contacts and click on them to call or text. Some sets even roll in the features above, so make sure you look at what your built-in set offers before you go installing one of them. Lifehacker's App Directory is a new and growing catalog of recommendations for the best applications and tools in a number of these categories. Category: dialer lock apphider apk
