Screenshot: Brendan Hesse (Android 10) I let dark themes on any OS, app, or website that allows me, and an update to Android 10 means that now I can install dark themes like default to search all supported apps and menus on a system level. While I'm perfectly content to just turn on the dark mode and never look back, you may prefer to swap between dark and light modes depending on the time of day or your environment. Unfortunately, even Android 10 doesn't include an easy way to do this, and you're forced to manually change themes from system settings or in every app if you're looking for outside help. Ideally, Android will have a built-in scheduler that changes between light and dark modes automatically in due course, but there happens to be a third-party app called Automatic Dark Theme, which makes this a very thing. Setting up this app is a little more difficult than usual, but it's absolutely worth a try. Set an automatic dark theme from Google Play.Put your phone into developer mode by going to the settings of the phone, and clicking Build Number seven times until you see a pop-up confirming that you've turned on the developer mode. Next, go to the options of the developer's zgt; system. Scroll down and turn on USB Debugging. Install the ADB on your computer with this 15-second installation package from the XDA forums. Connect your phone to your computer with a USB charger. Open Command Prompt on your computer by clicking on the Windows-R button and then typing cmd. In the team window quickly, enter: adb shell pm grant com.cannic.apps.automaticdarktheme android.permission.WRITE_SECURE_SETTINGSPress Enter to launch the team. Once you've made changes, you can close Command Prompt and disconnect your phone from your computer. You should also be able to disable USB debugging (for extra security). Screenshot: Brendan GessenS installed the app, here's how to set a timer in an automatic dark theme: Open the automatic Dark Theme app. Click on the slider next to Enable to turn on Click the Turn on the Dark Theme button or turn the light theme on to adjust the time each theme will apply. You can also change whether the app is applying the change at a specified time, or only while the screen is locked. Switching while Screen locked is the preferred option. Otherwise, any open apps or menus must be overloaded when the theme changes, which can lead to visual errors or performance issues. An Android security vulnerability that allows attackers to execute arbitrary code (i.e. their own code) has been tested on Google Glass and found present. The actual vulnerability dates back to the second half of last year, when security researchers that apps made against Android 4.1 Jelly Bean API can exploit a Javascript bug. The feature in question is addJavaScriptInterface. It was designed to allow Java Java access from JavaScript, but with limited coverage. However, at API level 16 and below, it is broken. To use it, the app just needs to create WebView and then run a code that gets access to a broken JavaScript function. The official Google API documentation for addJavaScriptInterface () has a note that recognizes that for applications made against Android 4.1 SDK, an attacker can manipulate the host app inadvertently by running Java code with the permission of the host app. The addJavaScriptInterface test module for Metasploit, a popular open source vulnerability testing platform, has recently been updated to provide access to the shell on some versions of the Android browser, as well as on derivative browsers from Baidu and Kew. In comments to the recently published Metasploit module, Joshua Drake noted that the execution of the code also works on my Google Glass XE12. The problem is that on Android, many free apps use WebView to download HTML content (such as developer website, instructions, and even advertising), and if that HTML content can be somehow modified with a man in the middle attack or with a malicious JavaScript in advertising, WebView may be forced to execute the attacker's code. Theoretically, the same could happen on Google Glass.According to a report published late last year by security company MWR Labs, a large number of SDKs used by advertising networks are vulnerable to exploitation. We analyzed a large number of SDK ad networks and found that many of these bridges are implementations that are vulnerable to operation. Some SDK ad networks derived from ad networks were directly deemed not vulnerable (in their latest versions). However, many apps on the Google Play Store have been found to be using older versions of SDK that are vulnerable. When watching a Hollywood blockbuster you may have sometimes scoffed at how easily hackers or government agents can hack smartphones, but in fact it might be easier than you think!
