The term close refers to different things for different people. For some, it includes family and close friends. For others, it includes lovers, boyfriends and girlfriends. And, for many others, it may even include favorite gadgets such as their Android phones. Regardless of the scope of the term, no one ever wants to lose a loved one. But accidents happen. We lose some, we win some. Losing your favorite Android phone - either by negligence or through theft - can be not only a sad moment, but also a dangerous moment, especially if you keep a lot of sensitive, personal information on your phone. So many questions can work through your head: Where is it? Did someone find him? Is he going to get it back? Has finder found access to my files yet? What will I do to find with the data on my phone? In this guide, learn tips on how to restore your Android phone. But, more than that, learn how to protect your phone, adjust it for easy recovery when it's lost, and prevent your data from falling into the wrong hands. (For a visual guide, you can watch the accompanying video guide at the end of this post.) Basic phone securityIf it is up to you to ever lose your phone. But when accidents happen, you want to be prepared. If an ounce of prevention is worth a pound of treatment, then providing your phone using built-in security features will be a good first line of data theft protection. So you can sleep well at night knowing that even if you couldn't recover your Android phone, the person who found it wouldn't be able to recover your data either. Basic security on Android phones includes the use of a security PIN for a SIM card, a lock screen code for the phone, display of the phone owner's information and phone/data encryption. They serve as the first level of security from prying eyes and people who may have intentions to spy on their phone. They also help to ensure that no one will be able to use your phone and your contacts without your permission. SIM lock protectionActive your SIM card's protective PIN will protect messages and contacts stored in the SIM code. When your SIM card is protected by a PIN, your phone will ask you to enter the SIM PIN after powering on your phone. To protect your SIM card with a PIN, go to the security of lock SIM card set up a sim card. Check the box for the Lock SIM Card option. You will be offered the default SIM code that should have been provided to you by your network operator. Don't enter the wrong PIN more than three times, otherwise you can lock yourself out of the SIM card and you'll have to enter the PUK code. Once the SIM card lock function has been successfully activated, you can also change SIM by default. For extra protection, some Samsung phones provide a mechanism to alert you whenever a SIM card is removed or changed on your phone. Most Samsung phones include this it's that requires a Samsung account. This feature is included in Samsung Find My Mobile. When the feature is on, the phone will send a message to your set number, notifying you that the SIM card on your phone has been deleted or changed. For phone users who are not Samsung's ones who don't have this feature, you can resort to apps such as SIM Card Change notifier or SIM Tracker. These apps can be downloaded for free from the Google Play Store.Phone lockEnabling's tighter lock screen security helps ensure that no one can unlock the phone without authorization. Android provides multiple layers of lock screen security, the least secure of which is Pattern Lock, and the safest of which is Password Lock. To set up the lock screen, go to the settings of the security lock screen. Path/location may differ on other OEM custom skins, such as TouchWiz. Among the options for screen locking techniques, you can choose one of the following: NoneSlideFace UnlockPatternPinPasswordDisplaying owner information about lockscreenOn most phones running Android 4.0 or above, you can also display the owner's information on the lock screen. Some people give up this feature, citing privacy considerations, but I think it's a very useful feature. For example, if I've passwordized my phone, a good-natured person who finds my lost phone won't be able to unlock my phone and it's going to be hard to know who to return the phone to - unless I prefer to display my contact information on the lock screen. To establish the owner information that will appear on the lock screen, you will usually find the option in the settings of the Owner Info. Any text you type in a text box will appear on the lock screen. Just make sure you set it to show on the lock screen. Be sure to provide important contact information: the owner's name, address, contact number (s), email address, etc. so if ever the Good Samaritan picks up your lost phone and decides to return it, she or he will know who to return it to and how to contact you. I suggest you also consider attaching the owner of the information sticker on the bottom of the phone or on the battery or in the battery compartment. Thus, the search of the phone will still find contact information in case your lost device runs out of power. Encrypting phone data from setting up basic security settings (such as SIM locking, lock screen, owner information), you can strengthen your phone's security further with encryption. With this feature, you can Internal phone storage and/or external storage (depending on the phone and OEM custom software). If you decide to encrypt your phone, you will have to set the password decryption and enter it every time you power on your device. The encryption process is irreversible. To remove the encryption, you will need to reset the phone, which means goodbye to all the phone data. Android device device have different ways of implementing the encryption function. On most Android phones (including the Nexuses), you'll find it in the settings of the 'gt; security of The Encrypt Phone.On Samsung, You'll find it in the settings of the Security zgt; encrypt devices and in the settings of the security's encryption of the external SD cards. If you use other methods of locking the screen other than a PIN or password, you will need to assign a password or PIN for decryption purposes. Backup dataIn much of the ounce prevention part is to back up the phone's data. No one knows the day or hour when one will lose her or her phone, so back up your phone data right now. Backing up your data, you'll always have backups of your data if you ever lose your phone. There's actually a lot of ways to back up your phone's data. You can use local backups (i.e. phone to computer) or cloud services (i.e. phone to remote servers). For more information, see our articles on how to back up your Android phone to the cloud and how to make local backups of your Android phone's data for more help. Samsung Find My MobileIf you own a Samsung phone, a built-in feature called Find My Mobile can be great in its use in an attempt to restore your Android phone. This is one Samsung-exclusive add-on feature that lets you lock a lost phone and/or destroy your lost phone's data remotely. You can also view the location of the phone and track its movement and location during the last 12 hours. Through the Find My Mobile website, you can also remotely call your phone, block or unlock your phone screen, receive call logs, and send messages and calls to the number you're pointing to. You can find the Find My Mobile feature, step back to the security settings of the security of the ggt; find my mobile. In order for this feature to work, you need to log into your Samsung account. Mobile data should also be activated on your phone. The feature can be a great time savers when trying to recover your Android phone. Mobile security and app trackingIf you don't have Find My Mobile on your phone, not samsung, it's not the end of the world for you. You still have a few alternative apps in the Google Play Store for and recovering a lost phone, or even remotely destroying your phone's data. The important thing to keep in mind about these apps is that you need to install them right now while your phone is still with you. Choose the one that suits your needs best and install it today before you LOSE YOUR PHONE. Antivirus Security - FREE When looking for an android app to help you recover a lost phone, one of the first apps you can look into is AVG AVG Security is a FREE app. In addition to being protected from viruses and malware, you will benefit from AVG's anti-theft feature, which will help you find your missing phone. To use Anti-Theft, you need to create an AVG account: you can use your Google account to sign up. The Anti-Theft feature is used in conjunction with a web console in www.avgmobilation.com, with which you can remotely control your phone and send commands that will be performed on your phone, including the following: screaming or sending a loud alarm, showing the approximate location of the device on Google Maps, locking the device and showing the custom message of the lock screen to help you find the device back to you, unlocking the screen, wiping all the data, wiping out all the data stored on the phone and the reformatting of the microSD card, and. In order for the above commands to be successfully obtained and executed using the phone, the mobile connection to the phone data must be active. Otherwise, the web console can't communicate with your phone. AVG SMS commandIf you forgot to turn on mobile data before your phone went to the Interior Ministry, what to do? AVG's anti-theft service can still help with SMS commands. SMS commands, however, only work if the phone's SIM card has not been removed or replaced, and provided the phone is on. You will also need to know your phone's AVG ID number in advance. You can find your phone's AVG ID number by logging on to a web console or by visiting the How to Use the Anti-Theft Page page in the AVG app. Also take note of teams that are sensitive to the case. Using any phone, just send any of the following case sensitive commands as SMS messages to your missing phone: ScreamMyPhone sets a loud alarm even if the phone is on Silent ProfileLocateMyPhone To find your phone: you will receive information about the approximate number of your phoneLockMyPhone UnLockMyPhone There is no SMS command for remote wiping of data, so you really have to use the missing phone in the web console to do so. The security/Another mobile app that can help you recover your Android phone is avast! A mobile security app, primarily an anti-malware app, which also includes a anti-theft feature. The anti-theft feature exists as an add-on module that needs to be installed from the app. If you lose your phone, you can execute commands remotely from your computer to Just go to your avast! account page, open a list of deleted commands and click the Send Button. With avast!, you can tag your device as lost, block it, sound sirens, find a device, erase data, and more. Make sure to enter your avast! account on your device for remote commands on work.avast! SMS teamsIf the web interface is not an option for you, you can be a missing one. Send remote commands via SMS via another phone. The message consists of avast! The PIN specified at the time of installation and the command in all the upper register. Here are some of the commands that you can remotely run on your phone via SMS:LOSTFOUNDLOCKUNLOCKSAGESIREN OFF-LOCATEWIPEREBOOTConvsive with most other mobile security apps and search phones with SMS remote command support, avast! Mobile security has the longest list of SMS commands I've ever seen. There are actually more commands (see the full list in Anti-Theft, Help, System State, About zgt; SMS commands) such as installing LOCATE intervals, changing calls and SMS, receiving call notifications, receiving SMS and contacts, setting up owner's information, installing a new avast! Pin and a few other extended commands. If the SIM card on the lost phone is deleted or changed - which almost always happens in case of theft - avast! Mobile Security will send a notification to the phone number stored in the app. Once the original SIM card is removed and changed to another, the app will automatically allow Wi-Fi, GPS and mobile data so that the app can perform its tracking duties and hopefully pinpoint exactly where the phone is. The phone settings menu also may not be available, preventing changes to be made on the phone. Where's My DroidThe Where's My Droid app is free, ad-supported locator device. This can help you find your missing phone via SMS commands. Unlike other mobile trackers and locator apps, this one does not need to register an account to be able to remotely control a lost phone. Alienman Tech, the app's developer, has also provided a website where you can send remote commands to your lost phone. Just enter your mobile phone number and select its mobile operator from the drop down menu on the website, www.wheresmydroid.com.commands called attention words. Here are some examples of SMS commands that you can send to your missing phone via another phone: WMD RingAvailable in the free version. Makes your phone ring even if it's on Silent or Vibrate Mode.WMD GPS Available in the free version. Lets you find your phone's location with another phone or a website. The phone's GPS should already be enabled so the app can report the location of the phone via SMS. WMD camera BackAvailable in the paid version. Takes a photo with the phone's rear camera and uploads it to the server. The app will text back the URL on the photo. WMD camera FrontAvailable in the paid version. Does the same as the previous command, but uses a front camera. WMD Lock In the paid version. Blocks your phone from unauthorized use with a four-digit PIN. WMD UnlockAvailable in the paid version. Unlocks the phone, bypassing the specified PIN. WMD WipeAvailable in the paid version. Wipes device data and/or SD cards, SD cards, Settings. Words of attention are also tuned. So, change the WMD Ring command to everything you like, such as Scream or maybe Shout and the latest new commands become new words of focus for this particular feature. Just don't forget the custom words of attention that you set. Upgrading to a professional version of the app brings more features such as shooting with a rear or front camera, remote device locking, remote phone wiping and SD card data, and more. It also removes ads. Lookout Security and AntivirusThe latest - definitely not least - mobile finder app that I recommend is a Lookout security and antivirus app. In addition to being an effective shield against viruses and malware, it also protects your phone data and helps you find your lost or stolen phone. For Android phones running on Android 2.2 to Android 2.3.7, you can use the Lookout B plan. This is the only phone tracking app that can be installed after you have lost your phone. It should not be installed in advance. Unfortunately, Plan B only works on phones running the said Android version. For phones running Android 4.0 or above, you have to do with Lookout Security and Antivirus.Just, like the rest of the apps mentioned in this article, Lookout Security and Antivirus also has an online analogue www.lookout.com. With your account, you can remotely let your device scream, even if its silent, backup phone data time, find your phone, and more. Cam lock and FlareTwo signal big things about Lookout security and antivirus blocking Cam and flash signal. Signal Flare automatically saves the last known location of the phone on the Lookout server before the phone runs out of battery. Meanwhile, Lock Cam automatically and silently activates the front camera and takes photos immediately after three failed attempts to unlock the screen. The photo and location of the phone are sent to the phone owner's email address. If you want to be able to remotely lock your phone or completely destroy your phone's data (such as messages, contacts, logins), you can do so in the premium version of the app. The paid version also allows you to back up photos and call logs. In the free version, you'll only be able to back up your contacts. Video GuideKnow details on the security of your Android phone and the recovery of your lost Android phone. ConclusionConsidered readiness. Definitely never lose sight of mobile security. Otherwise, you'll be counted among the foolish, who regret their gaffe later when they're more could get your data or recover your Android phone more. Have you ever experienced the loss of your phone? What was the experience? How did you recover your Android phone? Share your experiences in the comments.
