Skin color rgb anime

When choosing colors for your image, do not fret too much color choice. It's good to have some colors in mind when you start, so you can save some time and trouble, but if you later notice that you don't like one of the colors you chose, it's really easy to change, even after coloring and accents were

present. For example, let's say that I do not like Viviane blue hair color on the right. To change color, I first carefully select my hair using a screening tool so that I will not accidentally change the colors of any other objects that may also be on the hair layer. Then, on the View menu, select Adjust and Submenu select Hue/ Saturation. This will call the Hue /Saturation window. Adjusting the slider on three sets of bars will change its hair color. The shade will change the color of your hair, from green to blue to red, and everything in between. Saturation will change the level of saturation, from bright, very saturated colors to dull, gray. Finally, lightness will adjust the darkness or lightness of color. Hue/Saturation menu is a great way to experiment with different colors, especially if you're not sure which color you want to use in a particular area of your character. Colors change in real time, so you can see the color changes in the character when they are made. Once you have a new color that you like, just click OK, and you're done!
