Clinical orthopedic diagnostics is a comprehensive resource for medical students and graduate students and practitioners. The book presents students with the full preponderance of all recent developments in this discipline and gives readers an understanding of the practical application of orthopedics. This helps students understand how the clinical examination of orthopedics is conducted and how traumatic and non-traumatic cases are solved. The book is dedicated to practice in tropical and developing countries and presents illustrations and photographs to help readers learn how to diagnose and treat various orthopedic diseases. About sureshwar Pandey is an emeritus professor at Ranchi University and founding director of the GNH Handicapped Children's Hospital and the RJS Center for Artificial Limb. He is also the founder and honorary editor of the Journal of Foot Surgery, and serves as a visiting professor at the University of Tokyo, Osaka. Anil Kumar Pandey is Director and Consultant of the Rama Janam Sulakshan Institute for Orthopedics and Research (RJSIOR) and Assistant Director of the GNH Handicapped Children's Hospital and RJS Artificial Limb Center. Hegedus has a notable 21-year career as a leader and innovator in physical therapist education, Research and Clinical Practice and is the founding chair of the Department of Physical Therapy Doctor at High Point University. Dr. Hegedus is also the founder and director of the Targeted Advanced Sports Movement (TEAM), Community Health and ... Read the full bio background: Clinical diagnosis of superior laboratory front rear (SLAP) tears is extremely challenging. Most studies that promote selected tests have design errors or significant biases, or both. The purpose of this study was to determine the diagnostic usefulness of the Active Compression/O'Brien test, the Dynamic Laboratory Test Shear (O'Driscoll test), the Speed Test and the Labral Tension test for the diagnosis of isolated SLAP SLAP lesions (slap only) and slap lesions with associated disorders (e.g. rotator cuff rupture), and materials and techniques: The accuracy study was based on case-control design, which included 87 individuals with a variable shoulder Results: Of the 5 tests, only the Biceps Load II test demonstrated usefulness in identifying patients with SLAP-only lesion, with a positive predictive value of 26 (95% confidence limits, 18, 31), negative forecast value 93 (95% CL, 84, 97), positive probability ratio of 1.7 (95% CL, 1.1, 2.6), and negative probability ratio 0.39 (95% CL, 0.14, 0.91). No tests have demonstrated diagnostic usefulness in diagnosing any SLAP lesions, including associated diagnoses. No cluster has demonstrated better diagnostic accuracy than autonomous findings. Conclusion: There are a number of potential causes of poor utility in 5 test findings. The heterogeneous sample included patients with various shoulder disorders. The study was organized using very strict methodological controls that should reduce the risk of displacement, which usually overflies the accuracy of a particular tool. The findings may indeed reflect the autonomous, diagnostic utility of the 5 tests, suggesting when used alone provides little use for the decision-making of the diagnostic doctor.
