After an internal investigation launched in late 2006, Siemens finally admitted to uncovering questionable payments worth 1.3 billion euros in 1999-2006. As a result, Siemens replaced all but one of the board members. In late July 2008, a former sales manager for Siemens' telecommunications division was convicted for his role in creating slushy funds used to obtain contracts. On the same day, the supervisory board approved the recommendations of a well-known law firm to sue almost all members of the executive committee responsible for this between 2003 and 2006. The purpose of education is to educate students about the problems associated with corruption in international business. An image of Seimens through Dvice engineers at Siemens have come up with a clever way to recycle some of the energy the dishwasher uses during the washing cycle to make the dry cycle more efficient. Much of the energy used in the dry cycle goes to counteract the moisture created during the washing cycle, so the way to a more efficient dishwasher is to see how to improve this part of the cleaning process. For engineers in Seimen, the secret is not in a more efficient engine or the use of heat waste, but in the addition of the veal-based mineral that is in the container at the bottom of the machine. According to Davis, about three pounds of moisture-absorbing minerals called zeolites are held in a container at the bottom of the machine, and during the washing cycle they are heated together with water. During the dry cycle, zeolites release the heat they heat and absorb moisture from the air inside the machine. The moisture remains in the zeolite until the next wash cycle when the heating will release it back into the washing water. The result is a faster load cycle, and a 20% reduction in energy consumption compared to the most efficient conventional dishwashers. The mineral lasts for the duration of the machine, and the company states that it is stored safely inside the dishwasher. But of course the question becomes how safe it is when it comes time to recycle the dishwasher. Over the course of a car life, it seems to make quite an impact on energy consumption. Siemens states: Thanks to the drying of the zeolite, Siemens dishwashers take only 125 minutes to complete the regular cycle. This makes them, by some distance, the fastest in the world. Even better, the energy consumption is only 0.97 kWh, and despite the seriously fast washing time, the results remain as good as you would expect from Siemens (energy label AAA). The dishwasher model is available in Europe, but there is no such luck finding it easy here in the US.
