Android Auto stability issues seem to pop up quite regularly, and after the release of Android 11 last week, some users report a lot of pretty serious problems between them. Google may not directly link Android Auto to system updates, but major updates can be a source of error with experience in the car. As our friends over at Android Police recently noticed, that seems to be the case with Android 11. Apparently, the problems faced when Android Auto is connected to a phone running Android 11 vary from person to person. Some users say that the music is not playing smoothly, others say that the Calendar app is missing - although Android Auto v5.6 has apparently fixed that bug - and others mention muted notifications and phone calls that don't pass through car speakers. Apparently, Waze can also be partially broken for some. A couple of users even have their phones locking up to the point of requiring a reset plan! Not all drivers seem to be affected by these issues - my Pixel 4 XL seems to be working completely fine with Android Auto on the final 11 build - but there are definitely a significant number of people experiencing problems. Google hasn't promised to fix these problems yet, but given how widespread the problem seems, it appears the company will probably have something in the works sooner rather than later. However, Reddit users found a potential stop. Apparently, turning off the Bluetooth scanning device seems to help some users. Read more about Android Auto: FTC: We use income earning auto affiliate links. More. Check out 9to5Google on YouTube for more news: The Waze app, which has become necessary for several years in the field of GPS, is a great tool to help you find your way. Its principle, based on community assistance, also allows you to know in real time any disruptions or slowdowns on the road thanks to warnings issued by users. You can also set up a new app called Android auto, which lets you connect the Waze app to the car's dashboard. This allows you to focus on the dashboard screen, which is more practical. However, sometimes one of your apps, Waze or Android auto, no longer works properly, whether on your phone or on the car screen. The purpose of this article is therefore to help you fix GPS problems on the waze app or on Android Auto. HOW SOLVE PROBLEMS ON WA'E APP AND Android Auto ON ANDROID SMARTPHONE Here are various recommendations for fixing your Waze and Android Auto app problems on your phone and car. If your problems are more related to the localization of your signal, then we will advise our article on this more specific topic: GPS location problem on Waze, what to do? Maybe the problem is not in your smartphone: Le patch for the latest version of Android Auto (around February 2020) triggers direction directions which is no longer in the center of the screen to smash. From there, you can no longer follow directions that become promiscuous. On the Reddit forum, users mention compensation from the window responsible for showing directions. Sometimes updates can cause small errors in the use of certain applications. In these cases you have several options: Option 1 : You wait until the developers to fix this with the new update Option No. 2: You use another GPS app like Maps Option No. 3 : You can go back to the old version of your apps (we'll explain it to you in the next paragraph) RETURN TO OLD VERSION VASE APP Another solution to help you solve your display or other problems on the Waze app and Android Auto , go back to the old version. If you're aware of the app, it's possible that your app isn't compatible with your Android version, or as explained above, that this version is faltering. So you can go back to the old version of Waze, with a sound that worked properly. To do this, just download the previous version of Waze, which worked: You just have to download the correct version of the application, in THE APK format. You will have to do this from your computer and then transfer this installation file from your computer to your Android smartphone. For the Android Auto app, this is happening here: If you have any doubts about the APK file download and installation procedure, feel free to read our article specifically written on this topic: How to download and install an APK file on the Android phone CHECK THE CONDITION FROM SERVER VAZE It is possible that the sound problems just come from the Waze servers. There is a website that lists the live status of these servers to know if it is working normally or if there is a problem. Check this site before checking whether there is a problem with your smartphone or not: Unfortunately, there is no site list of server problems for the Android Auto app. MAKE SURE YOUR VASE and Android Auto APPLICATIONS UPDATED It's really possible that the Waze app you use doesn't work well because it's not up to date. As a result, the sound does not work properly. Go to the Play Store, then tab-installed apps to make sure you have the latest updates for your Waze GPS and Android Auto apps. UNINSTALL two apps, then FIRST to install them You must have already thought about this decision, but we still mention it. To quickly remove the app, just tap and hold the Waze logo for a few seconds, then when the d'installer tab appears at the top of the screen on the left, slide the logo with your finger until there, as shown in this example: If you use the Waze app and Android Auto in your car, and that it doesn't work properly, it can come from a cache of apps. the application is temporary data related to the launch and operation of this application. Your phone stores this information to speed up the process of launching and downloading the app. However, sometimes this information is corrupted or of poor quality, thus creating problems using Waze, materialized by card display errors. Therefore, you need to reset, empty, and clean the cache of these applications. Procedures are identical to two applications. It's very simple: go to the settings of your Android smartphone Open tab Applications Search app Waze and Android car, and then click on it Press erase data and empty cache as an example below When you use GPS as soon as you are no longer on the active page Waze signal stops. Most of the time, you won't notice anything. However, if the signal is not very strong where you are, this signal loss can lead to loss of location and your Android Auto screen transmits incorrect information. There is a free app available on the Play Store that lets you keep GPS constantly when you're moving with it, allowing you to increase your Android smartphone's GPS signal, and thus solve your GPS problems on mobile apps. This software is simply called GPS connected. You just need to download it from the Play-Store and then install it on your Android smartphone to be able to use its service. Here's a link to google's app page to see in more detail what it offers: Make sure the battery optimizer isn't turned on on Android Auto, as this can create GPS conflicts once your smartphone locks. To do this, follow this little manipulation: Open their settings with your smartphone Go on the Battery On tab on this page, tap 3 small dots in the top right of the screen and bat optimization rie From there, search in all the apps, Android Auto app Click on it, and then disable the battery optimization Search Clear Search Gose search Google apps Main Menu Android Auto Main Menu Android Auto /www.google.com/tools/feedback/metric/report If you run into a problem with Waze. If you would like to share feedback on non-Waze-related issues, please follow the steps outlined in this article: ANDROID AUTO FEEDBACK To send debugging logs to Waze: First, please make sure your device is not connected to your Android Auto device. Click Search. Search 2#2 in the search bar. Close Vase. Connect your mobile phone to your Android Auto device. Play the problem. Turn off your mobile device from your Android Auto device. Open Vase again. Click Reports and click Debugging or Click Search, then Settings. Scroll down, click Send logs and confirm. When you fill out the form below, please make sure to include the following information as well Your Waze username - find your username click Set up your account search and enter the time and date you played Matter Time and Date you submitted the Operating System logs to incredibly sophisticated pieces of software, so it's perhaps not too surprising that despite a few beta releases, a few bugs crept into the final release of Android 11. The update appears to have caused problems with Android Auto, resulting in some drivers not being able to play music or read notifications. There are many posts across social media about problems with Android Auto after the update on Android 11, including music cutting and output, no sound notifications, no calendar app, general connectivity problems, Waze not working, and calls not routed through car stereo. There are also at least two reports of an automatic soft brick connected phone (Pixel 3 XL, in one case), forcing the factory owner to reset a device that has yet to fix problems with Android Auto. One possible workaround was discovered by Reddit users Yevtsan and mtb_junkie, which involves turning off the Bluetooth scanning device in the phone's settings. While Google has not yet promised a solution for all of the above-mentioned issues, the Android Auto v5.6 update has already been released with a fix for the missing Calendar app. Waze is the preferred choice for many drivers out there, especially because compared to Google Maps and other alternatives, it can help beat traffic and find the fastest route in a crowded city. But sometimes, the experience with Waze is heavily affected by bugs happening all of a sudden, such as this problem, which seems to be happening to more than a handful of Android Auto users. What's happening here is that Waze no longer displays content on the screen, except for buttons that zoom in and out and send a report. The map simply does not load, which makes Waze largely useless, although in some cases sound alerts on the route continue to be provided through the car's speakers. I noticed this problem almost two months ago on my Android Auto head unit, but it only happened in rare cases. Others argue that it now happens on a regular basis, and a workaround that makes magic every time it doesn't actually exist. Reddit users recommend opening Google Maps and then returning to Waze to restore maps. It also did the trick for me, but not every time, so you could give it a try if nothing works. On the other hand, what actually fixed the problem for me was clearing the cache and data in Waze and Android Auto - I know it's not the most convenient workaround, but if there's no other way to get the app running, you could at least see if it makes any difference. Both Waze and Android Auto have been updated several times since I first this problem, but given that reports of this issue continue to be received, it is very clear that the fix was not part of these new releases. Currently Google has yet to recognize this problem, the problem, Your only option is to try the ideas mentioned here. And of course, if there's anything else that works for you, make sure you let us know in the comment box below. Below. android auto waze gps not working. waze app not working with android auto. android auto waze night mode not working. waze not working with new android auto
