1 Table Contents 2 3 4 5 6 7 8 9 10 11 DieHard Electric Battery Charger allows you to recharge without the presentation of another car. It takes longer, but is simple and requires only a AC socket. Always make sure your charger is designed to work with battery voltage. Most cars use a 12-volt battery. Set the charger to the correct voltage, usually 12 volts for the car. Switch the output selector to the right number of amplifiers. The smaller the number of amplifiers, the longer it takes to charge. Attach a positive charger clip to a positive post first for batteries that are negatively grounded, as most car batteries. Attach a negative charger clip to a negative post. Connect the charger to a grounded socket. Charge the battery until the needle ammeter indicates that the battery is charging. Turn off the charger when the ammeter indicates a full charge. Remove the negative clamps first. If the charger has a 200-amp jump start setting up, connect in as indicated, and try to start the car in about a minute. Most car batteries take two to three hours to charge on 10 amps. Don't let the battery overpay. If you need to use an extension cord, use only a heavy three-headed type. Turn your head when plugging in and disabling the clamps, in case of a spark. Heavy extension this website or its third-party tools use cookies that are necessary for its operation and are necessary to achieve the goals illustrated in cookie policy.
