Include a portable Wi-Fi hotspot to improve your mobile computing experience. Simple and fast. RELATED: Settings- More than that. Install Wi-Fi hotspot or protect your portable hotspot You can change the name of your phone's Wi-Fi Network (SSID) and secure your Wi-Fi network when it acts as a portable hotspot. Go to the settings of the wireless network and the more tethered and portable hotspots. Make sure your portable Wi-Fi hotspot is checked. Touch wi-fi hotspot settings. The Wi-Fi Hotspots Dialogue opens. Set your name and security settings as follows: Change Network TO USE: Just tap the Portable Wi-Fi hotspot icon in/out of subscription to the smartphone data plan you need for users of some telecommunications firms. A portable Wi-Fi hotspot is an app that, as the name suggests, allows you to turn an Android device into a Wi-Fi hotspot. In a few words, this app allows you to share your Android internet connection with other devices. You can also rename the connection and even set a password. The portable Wi-Fi hotspot basically provides a label for Wi-Fi tethering, an option enabled by default in the latest versions of the Android operating system. In addition, the app is extremely light (just over 3 megabytes), so you can use it on almost any device. There are times when turning your Android phone into a mobile hotspot can really come in handy. Learning to set up a binding on Android can be helpful when your main internet connection goes down, for example. In this post we'll show you all and all from creating a mobile hotspot to Android, so let's get started. Editor's note: Please take the time to find out your mobile operator and the service plan you have purchased. Not all plans allow you to tether and hotspot services, and doing so can incur additional costs. In addition, some phone operators may have disabled access options in general. We will try to get you up and working with several methods today, but this may just be impossible on your device. Read more: The best mobile hotspot plans you can find You've probably seen the access button in the device's fast settings drawer. While this is the quickest and easiest way to turn the mobile hotspot on and off, you'll want to take a moment to set things up first. Here's how you set up a hotspot connection on Android: Open the Settings app. Click on the Network and the Internet option. Choose a hot spot and a tether. Click on the point Wi-Fi. There are options on this page for the on and off access feature. You can also change your network name, security type, password, and more. Follow the instructions to customize the access feature to your liking. The hard part is over. All that's left is to turn on the hotspot function. Point. It's a handy switch to do it in Wi-Fi settings, or you can use quick notification shadow settings. Keep in mind that smartphone manufacturers can add their own user interface elements to the experience. This often means moving settings and options around. We based these instructions on the Android Settings menu in Google Pixel 3 XL on Android 10. Things can be a little different depending on what device you have, but it should be relatively similar. Next: These are the best mobile hotspots you can buy Set up to the mobile hotspot via USB It can also set up your mobile hotspot using your Android phone's USB connection. Just keep in mind that this won't work with every Android device. If you support it, here are the steps to do so. Use your Android phone's USB cable to connect it to your computer. Wait a bit for your computer to set up the connection. Open the Settings app. Click on the network and the Internet option. Choose a hot spot and a tether. Switch the USB binding option. The same process can be used to activate Bluetooth tethering, but we do not recommend it via Wi-Fi or USB because it is much slower. If you still want to do this, just connect other devices to the Bluetooth binding source instead of taking the number one step. Need something stronger?: These are the best Wi-Fi routers available right now Site a mobile hotspot with a third-party app Justin a recent smartphone should come with built-in access capabilities, but that hasn't been the norm in the past. Those of you who use old smartphones may not have the snap/hotspot option at your disposal, in which case you can rely on a third-party app. Two of our favorite options are PdaNet and Portable Wi-Fi hotspots. Download Portable Wi-Fi Hotspot What Next? There are a bunch of great apps in the Google Play Store that provide these and similar services for hotspots and bindings. Keep in mind that it's best to use the default Android or carrier tool. Third-party options for the few remaining users who still need such services. It is also important to keep in mind the security of using a mobile hotspot. You should be able to trust the access point that you have created for yourself, but if you connect to other networks, you may want to consider a VPN service. Click on the above link to go to the apk file download page or app purchase page. Hotspot Control is a tiny app that lets or disables the Portable Hotspot feature for Android. Normally you can just do it in Android settings, but on some devices this option is hidden, or only works if you have a SIM inserted. Hotspot Control does not meet these requirements, suggesting that the very functionality of the hotspot is actually still present and working on the device. No rooting is required. It's not DESIGNED BEAT YOUR CARRIER'S TETHERING PROTECTION - For some people it does (it depends on how this protection is implemented), but that's not what the app was made for. There's no point complaining that he's not doing it for you. This app is designed to get around some of the problems when setting up a local hotspot so that your devices can communicate with each other rather than the Internet (although this also works on multiple devices). You can set up an access point (hot spot) name and password, encryption is always used WPA2 AES and TKIP to keep it simple. On some devices that don't have the ability to cellularly connect to data (such as the Nexus 10) the hot spot won't issue an IP address - the app will automatically detect this situation and fix it, but the root is required for this option. Note that without root on these devices, connected devices can still communicate if they set up their IP addresses manually, but this is something for an advanced user. I personally need this to create a private network (even without a SIM card, and therefore without an actual Internet connection) in the field between a number of my devices. Some genius at Samsung has decided that my Note II should not have an access point if no SIM is present - I ask you to disagree! Maybe someone else has an application for this as well. Size : 80k Current version : 1.1 Required Android : 4.0.3 and above Buy now and save 70% Download Requires: Windows 7/8.1/10 Connectify Hotspot makes all your devices happy.
