CSV Actions to XLS - Conversion of the nowView file is another document file format Technical details In computers, the CSV file contains different values in the table, like the ASCII series (American standard code for sharing information) text lines, which are then organized so that each column value is separated by a comma from the next column value and each series starts a new line. CSV is one example of a delimit text file that uses a comma to separate values (many other CSV implementations allow you to use different dividers, such as rear or fast forward). However, CSV differs from other split file formats when using a double quote symbol around fields containing reserved characters (such as commas or new lines). The advantage of this approach is that it allows data to be transmitted across different applications.
