When Epic Games originally released Fortnite for Android earlier this year it made it exclusively available on Samsung devices. If you're rocking the Galaxy S9 or Note 9, then that was good news. If you have any other Android phone on the planet, it was a kind of bummer. Android: Fortnite Battle Royale, one of the most popular fighting royal games around, is finally on ... More This Week Epic has officially made the game available to the masses. At this point, whether you are a gamer or not, there is a good chance that you have at least heard of Fortnite. This free game has taken the world by storm and ended up earning the company hundreds of millions of dollars through in-game purchases. Fortnite made its way to PC, Macs, gaming consoles including The Nintendo Switch, and even Apple's iPhone. But what about Android? The good news is that Fortnite for Android is here. Unfortunately, not without any reservations. First, you must have a supported Samsung device until at least August 12. Secondly, this beta appears to have some serious

performance problems. Note: I'm a long time Fortnite PC player, but also tested the game on the Wide Apple iPhone before releasing the Android version. Our team also played Android on several devices, starting for the S4 Tab in the Galaxy S9 and older devices such as the S7 Edge. Sorry The experience just doesn't live up to what you get from a PC or even an iOS version of Apple. Performance: It's not great. I was a longtime Fortnite player primarily playing on my computer. To get most of the game on this platform, I had to rely on a fairly high performance processor and GPU. With my current setup, I have no problem with delay or graphics. So when I started playing Fornite Mobile first on the iPhone, I was surprised that the gameplay wasn't rubbish. Although the graphics weren't nearly at the level found on consoles or PCs, they are on par with other hit mobile games. But what was uprisng is that the performance didn't take a hit either. You have to remember that these games are filled with up to 99 people at a time that they all participate in one match. The same solid performance does not extend to Fortnite for Android, unfortunately. First, the game is limited to 30fps even on new devices such as the Galaxy S9 and Tab S4. Second, the graphics are significantly tuned down from the iOS version if you're not willing to put up with extremely poor frame rates. That's not all. Battery and data usage While this is true for the iOS version as well, this game eats up the phone's battery life. In my testing, I felt that every match was draining my phone's battery to 10 percent or more. I get that mobile games should help people pass the time and have fun on their phones, but when half a dozen matches drain most of the battery, you have to start thinking if it's worth a dead phone. Secondly, I can't recommend playing this game when you're not on WiFi. As mentioned earlier, Fortnite is a live multiplayer game that requires constant connectivity to the data of the other 99 users playing the match. This requirement means that you will start to deplete your data provided by your cellular carrier. Fortnite on Android: All the information about its unconventional release in one placeIf you can look past performance problems, the game is still in the playoffs, just frustrating. So let's take a closer look at the gameplay, game modes, and everything else. GameplayFortnite for Android is a battle royale genre game where the goal is to be the last player standing up. Each match begins with each character in a flying bus taking a random route over an island with several types of terrain and cities. At any time during this flyover, players can jump to the ground and start their journey. Fortnite modes are ideal for users who prefer to either play on their own or with their friends. To achieve this, Fortnite offers several different default game modes. These include solos, duets and squads. As the titles suggest, solos for those When users want to play in a team of one, duets for teams of two, and squads allowing up to four people to play together simultaneously. What's nice is that if you want to fight along with other others but you don't have any friends on the internet, you can automatically be paired with other people playing the game. Outside of these modes, Fortnite sometimes introduces modified game styles. For example, at the time of writing this article, the Battle Royale has a 50 v 50 mode where players are placed on a 50-character team and given the primary goal of eliminating all opposing members. Other past examples of shotgun and sniper-only game modes where players can only pick up and use these classes of weapons. In the game, weapons, tools, health and shields When a player lands for the first time in the game, they are given only a tool to harvest. Although it is technically a weapon, it cannot cause much damage to opponents. This tool is primarily used to collect resources throughout the map such as wood, brick and metalIf the player wants to survive, they will need to move around the map and either find weapons and explosives or open boxes that provide a random array of items that the user may want. In addition, players must stock up on healing items and shields. As the character can take damage from opposing gamers, they will want to rehearse whenever possible. Set up charactersIn the moment a new round of Fortnite begins, all on the same playing field. This means that no player will have the best power, weapon or capability when falling off a bus. The only advantage anyone can have is their own experience of playing the game. So why does everyone look different from each other? The simple answer to this question is that people have either unlocked or bought elements of the character settings. Each character's clothing appearance is the main difference between users. When players are new to the game, they get a few basic looking avatars that are not fancy. As you progress, a limited number of characters can be unlocked for free. But the way most people change their appearance by buying different outfits from Fortnite.I will explain the game's currency in a bit, but mostly, Epic Games releases different looks every 24 hours or so and people have the opportunity to purchase them. But don't worry if something disappears from the store before it can be bought, it will show back in a few weeks. Harvest tool, glider, emotions, and moreIn addition to outfits, players can customize their Fortnite avatar look by changing the look of their cleaning tool, glider, contrail, and more. Also, as outfits, players can unlock or purchase different designs and styles. Finally, one of the most popular aspects of the game is emotion. If someone celebrates a murder or just messs around, users can start in dance or action. In-game shopping To buy all options, users must use a virtual currency called V-Bucks. Throughout the game, users receive experience points that progresses them to a higher level. Every once in a while, one of the awards for promoting 100 V-Bucks. The problem is that everything in the virtual Store Fortnite costs at least 500 V-Bucks and can reach at least 2000 V-Bucks.So if players want a new outfit, emotions, or whatever, the only real option is to buy a virtual currency with real money. The exchange rate is approximately \$1 for every 100 V-Bucks. To motivate players to spend even more money, Fortnite gives a V-Bucks bonus when they buy large amounts of currency. Related: Fortnite can't come to the Play Store, and it's a terrible idea I broke different levels for in-game currency: Wingman Starter Pack - 500 v-bucks - 100 bonuses and \$4,991,000 V-bucks - \$9,992,500 lbs (bonus of 300 euros) - \$24,996,000 (bonus of 1500 euros) - \$59,9910,000 (bonus 3500 euros) - \$99.99Remember, Fortnite is a free game, which means that users technically never have to spend one dollar to play it. By buying V-Bucks and then exchanging them for character settings, these gamers don't get any advantage during the game. Having different outfits and accessories is more of a social experience than anything else. SeasonsTo make Fortnite more enjoyable, and make it more than just a game about killing other characters, Epic Games includes weekly challenges that players can complete to align faster and unlock new outfits, accessories and more. Each season consists of 10 weeks, and each weekly call tests the player's skills. Battle PassOfcourse, Fortnite wants to try to make money from his free game. So, in addition to purchasing customization features for avatars, users can purchase 25,000 V-Bucks and unlock Battle Pass. Again, there are no in-game benefits derived from spending \$25 every 10 weeks, but it helps users level faster and get free stuff. ControlsJust, like many other mobile video games, all the controls for navigation in the virtual world are at hand. There are two areas of gesture in the two lower corners that are used to move the symbol around. The thumb of the user's left hand will be used to walk or run forward, backwards or left or right. The thumb of the right hand is what allows the player to look around. Shooting, jumping, switching guns, interacting with objects, and moreY, as Fortnite is much more than just running around, there are many more buttons placed around the screen. Two easy-to-reach buttons near each navigation area allow the user to either swing the harvest tool or With a gun. Having two buttons in a lightweight location allows users to react quickly when they see opposing players or want to collect content. Since this transition is not always the fastest when in a combat situation, the mobile game has settings that can be On that automatically has the character to shoot your weapon when the enemy is in their crosshairs. I found this extremely useful because it allows the player to focus on keeping the opponent directly in front of them instead of moving and shooting at the same time. Epic Two other static buttons for squats and jumps. They are strategically positioned above the thumb of the right hand, so that they can be easily tapped while running or moving. Collecting weapons and accessories is easier on mobile devices than on other platforms. Instead of pressing a certain button, players must run over the item and it will be collected. If the gamer's inventory is full, they will have to click on the item and it has been exchanged for which weapon is selected in their inventory. BuildingOne is a significant part of Fortnite, which separates it from other Battle Royale games, as PUBG is the ability to build structures. Using material that is grown using a harvest tool, players can build simple walls, or they can practice and eventually make a skyscraper. I will say that it is much easier to do on other platforms. On a mobile phone, trying to move and avoid enemies, users should lift one of their hands from the screen, press a button to go into construction mode, choose the desired material and the desired type of structure (walls, floors, stairs or roof), and then hit the build. This process can be extremely cumbersome on a mobile phone and I ended up not even bothering with the effort during the game. On-screen audio indicatorsFortnite is a very audio-oriented game. By that, I mean that most of the strategy during the game comes from listening to other players and chests. But in this case, when users play on a mobile phone, they may not have the best speakers on their phones/tablets or be able to have sound at all. To help with this problem, Epic Games includes on-screen indicators to help direct or alert players about nearby sounds.Coming from PC, I found these metrics to be handy. Although Fortnite does an excellent job of identifying where the sound comes from being heard while wearing headphones, it can still be challenging to judge this accurately. These indicators detect this problem on a mobile phone. ConclusionFor people like me who have been playing Fortnite for months on another platform, it's nice to have the game available while on the go. Unfortunately, the experience just isn't great with the Android version yet. Keep in mind that this is still a beta, so a few updates can change everything. At this point, you're probably better off waiting or sticking to the game on a different platform. So that's all for our first look review for Fortnite for Android. We are we'll be back when the game gets a few updates under your belt. What do you think about the game, you had the same performance problems? Let us know in the comments. Related comments.
