You can usually easily format an SD card on your Android phone, Windows PC or digital camera. But sometimes you may encounter situations where you can't format an SD card due to numerous unknown reasons. So in this post I'm going to describe the reasons that lead to this problem and the fixes that will help you solve all kinds of SD cards not formatting the issue. So let's start... Because the SD card is not a formatting problem, you will end up losing the data stored in the SD card if you are already backing up your memory card data before the problem has surfaced. I say this because once the SD card refuses to format it is obvious that you will not be able to access its data and soon you will format it using the methods mentioned below, none of the data will be there to read. Thus, in both cases, you need to use powerful data recovery software to return all the data after formatting. Try the best SD card recovery software by clicking the button below, which will certainly help you recover the data after formatting the SD card. The free version of the program scans and scans recoverable objects. How do I identify an SD card that hasn't been formatted on different devices? Different devices send different error messages when they can't read or format a damaged memory card. Some of the popular bugs are mentioned below - On Android devices on Windows on a digital camera If you also get one of these or similar bugs, then you can be sure that your SD card is damaged. The reasons behind the release of the Can't Format SD card have already realized that when memory refuses to format, it means that the card has some problems with the file system. For example, a FAT32 card is used in a particular device, but when it's used in different devices, the file system becomes raw and therefore Windows PC can't recognize it. The memory card is not shown as mass storage and so on. Although he said that formatting the card would fix the problem, but ultimately the formatting fails as well. What causes such problems? Here are a few reasons that are responsible for the appearance of the SD card will not be a format issue - microSD cards write are protected and therefore Windows is unable to format it. The map has a bad sector and therefore it becomes damaged and there will be no format. Using maps in multiple devices such as phones, computers, cameras, tablets can easily make your card infected with a virus. Creating an android device and a Windows computer is unlikely to format a card to remove the virus completely. microSD card damaged due to file system, and therefore you get can't format SD card errors. And so on. So, whatever the reasons for the occurrence of a can't SD card format on Android or can't format windows PC SD cards, you can follow the following solutions to fix it. How to Fix A SD SD Format the question on Android/Windows PC/camera? The best solution to recover data with an SD card with a formatting error is the best solution for recovering and backing up data on a computer from a memory card that throws a unable-to-format SD card bug. If your card has important or valuable data that you want to back time before formatting, then it is necessary to follow the step for you. I say this because with the help of SD Card Recovery Tool you can get media files such as photos, videos and audio files from the can't SD card format. You don't have to worry about even if the SD card isn't available. This powerful SD Card recovery tool will completely restore all photos, videos and audio file formats. It doesn't matter if your card is protected, blocked, damaged, infected with a virus, or if it has any other problems. This will help you extract all media files with ease in just a few simple steps. The best part about this software is that it is available for both Windows and Mac PCs. To find out how this software works, contact its user guide. Delete Write Protection/Password from microSD Card This is the first thing you should check. If your memory card is locked, you have to unlock it. Check to see if there is a lock switch or not. If there is a lock switch and it is blocked, it means that your card is protected from recording. So, how do you take the record protection off the card? Simply slide the switch to unlock the position. That's it. If you have blocked the card with a password, simply remove the password from the card. Repair file system Errors and bad sectors on the SD card Insert a microSD memory card for the card reader and connect it to the PC. On your computer, click on all the accessories - Command Prompt. Now enter the following command: chkdsk D:/r and hit ENTER. (Here you need to replace the letter D with the letter drive of your microSD card.) Now, you have to just wait for the process to get full as Windows fixes all file system errors and bad sectors. Map format on your computer If your Android can't format the SD Card Note: microSD card formatting will erase all the data stored in it. Connect the card to your computer with a card reader. On your computer, click on my computer's right to click on the microSD card and click on the Format option. Leave all the default settings as it is and click on the Start button. Once the format process is complete, you can re-insert it back onto your Android phone and reuse it again. SD card format and reset for NTFS You should use management when you're not able to format an SD card on your computer. Connect the microSD card to your computer with a card reader. On your computer, click the qgt; control panels for the system and security of the administrative tools. Next Next control your computer and then click on the drive control. Now find and click the right button on the microSD card you want to format, and then click on format here select the file system of your microSD card in NTFS and then click OK to start the format process. Once the process is complete, you can extract the card from your computer and then re-insert it back onto any Android phone or other device to save the data again. You can then disable the SD card from your computer and insert it into your Android phone or other devices to save data again. Frequently asked questions) Well, to fix an SD card that won't format the issue in the first place, try removing the card from your mobile phone or camera, and re-inserting it again. Then, if the problem is still there, then take out the SD card and connect it to a Windows PC or laptop. Choose from the following SD card formatting methods on Windows 10/8/7 PC: External SD Card Format using the cmd Format Android SD card using Disk Management Error Message will not format the SD card often occurs for the following reasons: the SD card is infected with a virus. There are bad sectors on the SD card. The SD card has been damaged due to file system errors. To format an SD card, you can try the Windows Drive Management Method. To do this, first, open the drive control by switching to that computer/my computer to zgt; control qgt;. Then find and click the right button on the SD card and select the Format option. Choose the right file system, such as FAT32, NTFS, exFAT, and run a quick format. Then click THE GOOD. Conclusion there are several reasons for the occurrence of a can't format microSD card issue and a few solutions to fix the same as well. From the aforementioned blog, you had to learn how to fix an SD card that wouldn't format the issue on Windows PC, Android phone and on camera. However, if you have valuable photos, videos or audio that you want to recover from your microSD card before formatting, then you should use the SD card recovery tool. This tool will certainly help you recover lost data from an SD card for some time. Alex is an expert technical writer with 7 years of experience. What's wrong with my SD card when my computer can't format my SD card? a micro-SD card that can't format or delete files? An SD card or Secure Digital card is the biggest asset these days when we are all prone to digitization. Contrary to its tiny size, it helps more. It can be used in electronic gadgets like mobile phones, laptops, cameras, portable media players to name a few, and saves a lot of GBs at once. People also use it to transmit their data or store data as a backup. However, like higher users, there are many others who are faced with an exact problem i.e. they cannot format SD cards. If you are also one of them, you may have a lot of doubts in your mind as to why your Micro SD will not format and what can be done in such circumstances. So to help you, we're here with some useful information that certainly serves your purpose. Before we take you to the workaround the SD card will not format the issue, we would like you to know more about the problem. You should always know the possible causes of this issue. And so in this section we'll share some reasons that will answer you why you can't format an SD card. We know how important your SD card is to you because it acts as a much-expanded storage environment for your device. However, given the length of life, the SD card is prone to corruption. And if you keep inserting and removing it from different devices, the problem is sure to happen, and where comes the formatting of the SD card is convenient. But when you try to accomplish it, you are not able to do it. Why? Your mind can be murmuring a lot of things when such a situation occurs. However, you no longer have to think much as these moments will clear up your doubts. Check it out! Write Protection on the SD card: One of the reasons you can't format an SD card is to protect the record on it. Chances are, your SD card is secure, which is why Windows can't read it or make further changes or settings. Bad sectors: Another reason may be the bad sectors on the SD map. And as a result, the map is no more active and has become spoiled. Not to mention that Windows won't be able to format a damaged SD card. System file errors on the SD card: Your SD card is probably damaged for some other reason. The cause may be system file errors. And you already know that Windows will refuse to work with a damaged SD card. Viral infection: Finally, the culprit may be a virus or malware. You may be connecting an SD card with multiple devices or card readers. And doing so can easily welcome unwanted viruses. Therefore, you can't format your SD card with Windows. Part 2: Fast solutions to fix the SD card will not format the errors Now you can move on to resolutions that can help you fix the SD card will not format the problem. We're going to mention four different ways where you'll also learn to format an SD card using different methods. Let's find out now for each process. Solution 1: Remove the credit protection on the SD card To write protection simply means that your SD card is set to read only the function. And so this may be the reason why you can't format an SD card. If that's right, all you need is to remove the record protection from your SD card to make it run smoothly. So to correct the micro SD error won't format, the first solution is this, and here are the steps to follow. Step by Step 1: Run the Run Window first, using Windows and R Keys. Step 2: Enter the discpart and press enter after that. Step 3: The drive window will come to where you need to enter the commands mentioned below. Make sure to press the Enter key after each of the commands below. Here's: list the drive select drive (here - means that the drive that has a section of record protection) attributes the drive to read clearly only you need to close the window when you will be shown Diskpart attributes cleaned successfully. This means that the issue of can not format the SD card is solved. Solution 2: SD card format on the SD card format Formatter If you've done the removal of recording protection on your SD card and still have a problem, you need to format the SD card using a formatted third-party SD card. When browsing the web, you will learn options galore to get the goal solved. One such formatted can be the SD Association. These third-party utilities can help you cope with various SD card problems. Thus, look for the best option and get rid of the SD card will not format the issue. Solution 3: SD card format with CMD Here's the next way to solve the problem Micro SD card will not format. You can use CMD or team tips or you can also tell cmd.exe. Tip Command helps manage various problems such as hard drive errors or system problems, etc. and if the above fixes weren't used, you might just try it out when you can't format your SD cards. Here's what you need to do. So if you're not comfortable with the idea for the team or you're not familiar with it, we don't recommend formatting your SD card this way. Step-by-Step Step 1: Open the command tip first and for that you can simply enter cmd in the search box and select Command Prompt from the menu. Or you can click the right button on the Start menu and choose Command Prompt from there. Step 2: When the window opens, wait a second and enter Diskpart and click Enter. Step 3: Go along with the following teams. And as above, be sure to press the Enter key after each command. select drive list (here - means disk number) section list select section (here - means section number) fsntfs format quickly The aforementioned commands will help your SD cards get formatted quickly, and you won't have to worry about the SD card won't Question. Solution 4: SD Card format with disk-driven drive control To control disks and sections in the system, you can use Windows Windows the manager of the section, which is the management of the drives. It can be used to serve a variety of purposes, such as creating a section, deleting a section and the like. And we'll use it to format the SD card in this section as a solution when you can't format an SD card. Let us know how you can do it. Step by Step 1: Start by clicking right on the Start menu and choose the Drive Management option from the menu. You can also open the window to run with a combination of Windows and R keys and enter diskmgmt.msc to run disk management. Step 2: Now select the section on SD that you want to format. When you choose, click on it right and select the Format option. Step 3: When the pop-up window, mention the volume mark, file system, and the distribution unit size in the respective fields. Hit on OK after that. Please note that the option called Run Fast format is checked by default. You can stop it if you don't want the full format. In addition, the deleted data will not be restored. Step 4: Now, you have to confirm the process by clicking on OK again. Bonus Tip: How to recover lost data with a micro SD card with no bug format if your SD card is still stuck with no bug format and you want to get the lost data back, don't worry.
