Transfer manuscripts or sending through ScholarOne Physiological Reports online only, an open-access journal that will publish peer-reviewed studies in all areas of basic, translational and clinical physiology and related disciplines. Physiological Reports is a collaboration between a physiological society and the American Physiological Society, and therefore in a unique position to serve the international community of physiology through a quick time for publication while maintaining a standard of sound research quality that represents a useful contribution in this area. The documents will be accepted solely on the basis of scientific rigor, adherence to technical and ethical standards, as well as evidence that the study is well thought out and the data support the conclusions. All articles published by Physiological Reports are fully open: immediately freely available for reading, downloading and sharing. To cover the cost of publishing, Physiological Reports charges for publication. Reasons for publication with physiological reports: The unique collaboration between the Physiological Society and the American Physiological Society High Standard, Strict Peer-reviewed review - Fast Publication Open Access - Published articles are licensed according to Creative Commons, and the authors are rights holders in accordance with the mandates of open access Widespread Promotion and Publicity of quality research Submissions Submit your manuscript directly to the ABOUT PHYSIOLOGICAL REPORTS Physiological Reports Online, an open-access journal that publishes peer-reviewed studies in all areas of mainstream translational physiology. Case reports are acceptable as long as they have a physiological focus, but physiological reports do not publish clinical trials. For more information, see the magazine's full statement. Editors and reviewers attach great importance to manuscripts that provide clear and concise text and meet accepted standards of American English style and use. Authors for whom English is not their first language are strongly encouraged to seek help from a professional English editorial service; More information is below. PEER REVIEW AND PUBLICATION PROCESS MANUSCRIPT REVIEW The Editor-in-Chief or Deputy Editor-in-Chief will evaluate all manuscripts submitted in the Physiological Reports on consistency with goals and scope, as well as the quality of science and the relevant state. Manuscripts deemed appropriate will be reviewed by at least two reviewers prior to a decision. In the event that the manuscript was transferred from another journal along with previous reviewers/editors, editor-in-chief, deputy editor-in-chief or deputy editor-in-chief reviews to consider. However, they can select additional reviewers to evaluate the manuscript. The revised manuscripts, which required major changes, will be reviewed again by the original reviewers. Editors should, at their discretion, submit revised manuscripts that required minor changes to the original reviewers for the next round of review or make an immediate decision based on changes and responses to comments. PREFERRED/NON-PREFERRED REVIEWERS Authors are invited to offer at least three relevant reviewers and their email addresses. Authors can also list any persons they wish to exclude from the manuscripts, most often because of a conflict of interest. Editors reserve the right to accept or reject these requests. RESPONSE TO REVIEWS Authors of manuscripts deemed to have sufficient interest and quality but in need of changes before publication will be invited to review their manuscript. When sending a revised manuscript, point to point-by-point fashion each critique/comment from the editor (s) and fellow reviewers with the appropriate author's response, especially if you disagree. MANUSCRIPT TYPE 1. Original Research 2. Editorial 3. Letters to the editor 4. Case reports (with a clear physiological focus) 5. Reviews GUIDANCE ON PREPRINTS This magazine will consider for consideration articles previously available as preprints on non-commercial servers such as ArXiv, bioRxiv, psyArXiv, SocArXiv, engrXiv, etc. Authors can also publish the final published version of the article as soon as it is published. General INSTRUCTIONS Manuscripts must be presented in grammatically correct American or British English consistent throughout the manuscript. Authors for whom English is not their first language may wish to consult with an English-speaking colleague or consider professionally editing their manuscript before sending to improve the English language. A list of independent editing service providers can be found on . All services are paid for and organized by the author, and the use of one of these services does not guarantee acceptance or preference for publication. The manuscript is considered for consideration and possible publication provided that it is presented exclusively in Physiological Reports and that the manuscript is not considered elsewhere. ORIGINAL RESEARCH We impose very few restrictions on how you prepare your article, and there is no need to try to reproduce the layout of the magazine in your presentation. We ask only that you put your manuscript in a clear, general and readable layout, and That all relevant sections are included; figure (s) and table (s) (s) not included in the same document file as the main body, and should be downloaded as a separate file (please refer to the picture and table guidelines below). We recommend adding page and line numbers to the text of the manuscript so that reviewers can refer to specific sentences. Our manufacturing process will take care of all aspects of formatting and style. The list below can be used as a checklist to ensure that the manuscript has all the information it needs for a successful publication. . The title page, including the title, the names of the authors, Affiliation authors and contact information Abstract and 4-6 keywords Headline running, no more than 50 characters and spaces Text (introduction, materials and methods, results, discussion, conclusions) Literature cited (see below for tips on links) Confirmations, including details of the financial bodies with grant numbers Statement of Disclosure Tables (if necessary can be sent as a separate file . At the editor's discretion, Physiological Reports will publish letters to the editor that deal with specific issues in manuscripts published in the journal. There is a limit of 1,000 words (except for the title, authors, affiliations and references). 3. References are limited to 10, which should include a manuscript that letter addresses 4. Letters should not include abstract, keywords or a running title. The letters are reviewed by experts. There is no guarantee that the letters submitted will be published. The authors of the manuscript to which the addresses of the letter will be sent will be given the opportunity to respond. This response will also be reviewed. Both the letter and the reply will be published at the same time, if possible. Only one round of correspondence between the authors of the letter and the authors of the reply is allowed. 9. There is no charge for letters and replies. CASE REPORT 1. There is a limit of 2,000 words (except for the title, authors, affiliations and references) 2. Numbers and tables are limited to two of each paragraph 3. Abstract up to 200 words to be included 4. Introduction, case report and review of relevant literature to be included 5. The case report and discussion should have a physiological focus 6. The case report is usually written by an intern, in conjunction with a doctor and physiologist 7. Case reports are reviewed by experts. There is no guarantee that the reports submitted in the case will be published by 8. Clinically qualified associate editors will be Reviews. Currently we have two such AEs. 9. Normal ethical criteria for working with people agreed by the Societies must be met by up to 10. There is a fee of \$1,000/643 pounds /753 pounds for reports of cases Physiological Reports approves THE CARE (www.CARE-statement.org), and the authors are encouraged to refer to the CARE Statement Checklist on . All reports of cases involving human patients require the signed informed consent of a patient or relative if the patient cannot consent. Please use either the Patient's Consent Form of Physiological Reports or any other suitable form of consent (e.g. from your own facility). You don't need to download consent documents when you send the manuscript, but we can request copies at any time. ARTICLE 1 REVIEW. There is a limit of 3,000 words or through negotiation for guest reviews 2. Figures are encouraged and up to 10 can be included 3. Abstract up to 200 words to be included 4. Reviews are reviewed. There is no guarantee that the review articles submitted will be published 5. There is a fee of \$1,000 / 643 euros / 753 euros for uninvited reviews (there is no fee for invited reviews) PHYSIOLOGICAL REPORTS - CASCADE PROCESS Physiological Reports receives submissions directly from authors and through a cascading system from other journals. In journals, that cascading work for physiological reports mostly belong to two societies that own the journal: the Physiological Society, and the American Physiological Society. Acta Physiologica, owned by the Scandinavian Physiological Society, also cascades of work for physiological reports. The full list of cascading journals (support journals) is below: AJP Cell Physiology Endocrinology and AJP Metabolism AJP Cardiovascular Physiology Integrative and Comparative Physiology AJP Renal Physiology AJP In the Journal of Neurophysiology Physiological Genomics In the Journal of Applied Physiology Physiology Gastrointestinal and Liver AJP Cell and Molecular Physiology AJP Lung In the Journal of Physiology (en) Experimental Physiology Indicators of Rejection Of Journals Support Of Physiological Reports Highly Physiological Reports: From 44% to 75%. High-quality documents are rejected from support journals on the basis of novelty or perceived potential impact, or are studies that are considered incremental, corroborating, out-of-scope or showing negative results. This

is where physiological reports play a role in obtaining these documents in Community. The publication of negative results and supporting studies is a contribution to scientific literature, often overlooked by other quality journals. These documents should be well thought out, scientifically based studies, where the methods and results are fully explained so that other scientists can repeat the studies and compare the results. The findings should be supported by data. Thus, the translation is offered only by the best of the rejected documents. How it works: Where good quality research deserving of publication is rejected by a proponent of the journal, the article refers to physiological reports. This is done to deviate with the referral decision from the supporter of the magazine. The text in the disclaimer explains that the manuscript was rejected with a recommendation for progress in physiological reports without guarantee of a specific result. At the moment, the author decides whether to take the direction and pass the document into physiological reports. If the author asks to submit his work by clicking on the built-in link, details of the document including reviews from the magazine by a supporter are available to the editorial board of Physiological Reports. Access to this data occurs only if the author agrees to transfer. Authors may decide to refer with or without reply to previous comments by reviewers and review their paper before handing over. At this point, the editors of the physiological reports evaluate previous reviews and, if they are presented, the authors' responses to these previous reviews and changes made to the manuscript before issuing an editorial decision. If necessary, editors seek advice from outside reviewers. Submitted documents that have not been reviewed, such as when a document goes beyond a cascading log, are always sent for external review. PHYSIOLOGICAL REPORTS - STEPS TO PRODUCTION 1. Send or confirm your view on . 2. We will email you confirmation of your submission data. 3. Once you've been reviewed and accepted, Wiley Author Services will contact you to encourage you to log in/register and sign the Open Access Agreement. You will need to pay for the publication of the article. You can then track the progress of your article through Wiley Author Services. 4. You will be notified that your evidence is ready for review and you will be able to make adjustments to your article using electronic annotation tools to electronically correct the evidence. 5. Your article will be published on Wiley Internet Library and Highwire Press. If you subscribe to alerts through Wiley's Author Services, you will be sent an email when your article is published online. OPEN ACCESS AGREEMENT We have introduced a new process Signing the Electronic Open Access Agreement (eOAA), which will save you time and effort. If your manuscript is accepted, the author of the correspondence will receive an email with a link to the online form eOAA. This will allow the author to fill out the form electronically on behalf of all the authors of the manuscript. You can view copyright terms here. ARTICLE PROCESSING CHARGES Physiological Reports charges a publication fee (\$1,600/1,029 pounds /1,205 pounds for each paper logged). There is a fee of \$1,000 / 643 / 753 pounds for reports of cases. There is no charge for letters. EDITOR-IN-CHIEFThomas Kleyman, MD DEPUTY EDITOR-IN-CHIEFMorten B. Thomsen, PhD Address correspondence to the editor: physiologicalreports@wiley.com submission The Journal requires authors to submit electronically through the online presentation site in . ORCID ID ORCID is a service for authors/researchers that unequivocally defines your contribution to scientific literature. We encourage you to register. ScholarOne has direct links to orcid.org. To go to the link, click on your name in the top right direction and then click on the email/name in the drop menu. Creating and linking an ORCID account is the first section. Clicking on the editing account in the top right-right to the right of the screen and adding an ORCID ID to step 3 of your ScholarOne account for the information you will be registered with us. Title PAGE Title should contain no more than 160 characters (including spaces). Include species, tissues, organs or systems if this is important in the context of conclusions. Avoid specialized cuts if possible. The title page should contain the full title of the article; The author's name (s); All departments and agencies where the work was done; abbreviated name for a running head (limit of 70 characters); and the author's name, email and physical address for correspondence. Only one author can be appointed as the author concerned. The Editorial Board endorses the general principles established in the Good Practice Guidelines for Publications prepared by the Publication Ethics Committee (COPE). The author who submitted the manuscript must ensure that all the authors listed are entitled to authorship. Each author must take responsibility for a particular section of the study and contribute to the writing or review of the manuscript. Purchasing funding or collecting data not only justifies authorship; these contributions should be listed in the Confessions. Additional information such as X and Y contributed equally to this work can be added as a footnote on the front page. If the authorship of the manuscript changes during the publication process, the notification change signed by all authors, including the names have been added or removed from the manuscript to be sent to the editor. AUTHORS IN CHINA Please visit the Author Resources website at WileyChina.com additional resources and bilingual, short presentations on various topics of interest. ABSTRACT Unenmered single-point annotation of no more than 250 words should briefly learn: Why it was done (preferably indicated as a hypothesis) What was done (including species and conscious or type of anesthesia What was found (in terms of data, if space permits) What was concluded Links cannot be given. If it is directly related to the subject of the manuscript; an extensive historical review does not fit. It is often helpful to end up with a statement stating what your goals are and they should logically follow from your review. MATERIALS AND METHODS Methods Are described only once and do not appear in legends to numbers and tables. Details should be sufficient to allow the work to be repeated by others, and quotes from previous work giving more complete information should be made only when 100% identical. Describe the methods used by the cell/animal models used, including the source of the cells used (species, strains, gender, race, donor age, whether primary or established), as well as lists of reagents, chemicals and equipment, as well as the names of manufacturers and suppliers, including the city, state (if applicable) and the country for these deliveries received on the Internet. Own (brand) names must be capitalized, and spelling is carefully checked. A common name or common descriptor accompanies a trade name when it first appears. Other data relating to unique biological, biochemical and/or immunological markers should also be included, if any, with their source. It is expected that the authors will make unique reagents (including animals) available to qualified researchers either directly or through a recognized distributor. For studies involving humans, the gender of the participants must be reported. In addition, this section describes the statistical methods used to determine sample sizes and evaluate data. For human or animal investigations, a protocol approval application from the Institutional Review Board (IRB) or Institutional Review Board should be included Animal care (IACUC) or equivalent statement. Editorial approves the EXECUTIVE Guidelines for reporting experiments in vivo, including but not limited to: Design Research: A detailed number of experimental and control groups. Describe steps taken to minimize the effects of subjective bias (e.g. randomization or blindness in analysis). Describe an experimental unit (e.g. one animal, group, or animal cage). · Experimental Procedures: Provide accurate information about all procedures performed, including: o How (e.g., drug composition and dose, place and route of administration, anesthesia and analgesia used (including monitoring), surgical procedure, euthanasia method). When (e.g. time of day). o Where (e.g. home cage, laboratory, water maze). o Why (e.g., the rationale for choosing a specific anesthesia, the route of administration, the dose used). · Experimental Animals: Provide detailed information about the animals used, including species, strain, gender, stage of development (e.g. middle or middle age plus age range) and weight (e.g. medium or average weight plus weight range). Provide additional relevant information, such as the source of the animals, the international range of the strain, the status of genetic modification (e.g. knockout or transgenic). Provide detailed information on how the genotype has been identified/verified. Provide a source of animal control (e.g. littermates purchased, identical, historical, etc.). · Housing and housing: Provide detailed information about housing (type of facility, for example, a specific pathogen, free of SPF; type of cage or shelter; bed material; number of cage mates; reservoir shape, etc. for fish); livestock conditions (e.g., breeding program, light/dark cycle, temperature, water quality, etc. for fish, type of food, access to food and water, enrichment of the environment); assessments and welfare activities that were conducted before, during, during or after the experiment. · Sample size: Specify the total number of animals used in each experiment and the number of animals in each experimental group. Explain how the number of animals was delivered, and screw up the details of any sample size calculation used. Specify the number of independent replications of each experiment, if appropriate. · Give full information on how the animals were distributed to experimental groups, including randomization or comparisons if done. Describe the order in which animals in different experimental groups were treated and evaluated. RESULTS provides experimental data and results, as well as the exact statistical significance of the data and the test used. Please provide as many details as possible that are compatible A simple understanding of the text of the results Details of the data should be presented as an application or additional data file if included in the main results section of the results too bulky. In presenting the data, the authors should use SI or other metric units, rather than the usual units of the British Empire or the United States. Numbers or graphs showing individual values are better than just presenting solid bars indicating an average value, unless the number of observations is large, in which case you can use a box and mustache. These initial traces of data allow reviewers and readers to judge the quality of the data that the authors were able to obtain and the normal experimental noise or variations. A figure that combines a typical experimental footprint and then shows average data with error bars and value usually works best. In the case of data that is not normally distributed and converted by a log for analysis, if the image shows untranslated data, the tools and bars of errors should be shown as reverse medium and SE converted data. Since Physiological Reports is an online-only journal, the authors are encouraged to make full use of the color, but check the clarity is maintained if printed out in black and white. There is no fee for colored shapes. Authors should ensure that their data is processed correctly and, if necessary, seek statistical advice. Dispersion analysis (ANOVA), rather than t tests, should be used for multiple comparisons; parametric and non-marathon statistics should be used appropriately, and special attention should be paid to tools and errors if the data were converted to a logarithmic scale. The standard deviation and standard margin of error should be specified and used appropriately as a measure of variance and accuracy of the total value and are given with an appropriate number of significant figures. The value of n should be specified, and if necessary specify if it is about the number of animals or drugs, and use N and n to distinguish. Value tests should be specified in each case (e.g. in the legend of the figure) and in full (for example, the test of the student in the pair t). DISCUSSION Explain your interpretation of the data, especially compared to the previously published material in The Help. We require that your discussion text be balanced and include discussion of inappropriate data published elsewhere, and that you consider including a section where you discuss restrictions on your location. REFERENCES Completeness and link list content are more important than the format you choose. Therefore, we do not limit the number of links that you can quote, but will be guided by comments from reviewers regarding their appropriateness. A clear and consistent, overall style will help the accuracy of our production processes, but there is no need to try to reproduce the magazine's own style, which in the production process. If you use bibliographic software to create a list of links, choose a standard output style and check that produces complete and comprehensive reference lists. The final magazine outing will use Harvard-style reference quotes. If your manuscript has already been prepared using the Vancouver system, we are very happy to receive it in this form. We will transform from one system to another during production. CITING UNPUBLISHED OBSERVATIONS, PERSONAL COMMUNICATIONS, AND IN PRESS MANUSCRIPTS Submitted manuscripts that are still in the process of being prepared or in expert evaluation and/or any other unpublished material, observations or personal communications may not be included in the reference list. However, such material may be included in the text, but the authors will have to confirm when presented that all persons recognized in the manuscript are aware that they recognize and endorse the order and context of recognition. This includes, but is not limited to, the following circumstances: the publication of information disclosed in a personal message or unpublished observations; Recognizing additional facts that helped prepare the manuscript; to allow the copyright holder to discuss information that has been accepted for publication but is in the press and is not yet available, online or otherwise. DATA CITING DATA deposited in storage can be quoted in how any publication will be cited. Referring to data or making claims based on data, refer to the data in the text and provide an official quote in the reference list: Authors: A year; The name of the dataset Data repository or archive; Version (if any); Persistent ID (such as DOI). Please note that this citation style is not intended to take the place of social standards, such as the online citation of GenBank joining codes. CITING OTHER ONLINE RESOURCESReferences to online research articles should always include DOI where possible. When talking about other web pages, it's helpful to include the date you had access to the resource. SHARING DATAPhysiological Reports encourages authors to share the data behind their work and archive it in the public archive. The magazine's publisher provides this data-sharing service. Authors should include a statement on the availability of data, including a link to the repository they use, so that the statement can be published in alongside their document. The escrow instructions can be found . All document-related data should be deposited as data files, rather than published with the article as supporting information. SUPPORTING MATERIAL For data guidelines see, where possible, the scripts and other artifacts used to create the analyses in the article must also be publicly archived. Video and audio files (Fast time, SWF), code, glossary, applications and similar material that cannot be published in the article journal can also be presented as an additional data file. Such materials must be submitted for review along with the manuscript and must be consistent with the approval of the editor of the journal. For all additional materials, the authors must include a title for each file explaining the purpose and content of the file. Authors must submit these materials in the same way as data files (see SHARING DATA) so that they can be deposited by the publisher. Materials such as numbers, tables, text (e.g. methods or results), equations, and other materials that can be easily copied and printed on the finally published PDF page cannot be presented as supporting material. Such paragraphs should be included in the article as standard numbers or tables, or should be provided for submission and consideration purposes only (marked as such) and not for final publication. LINKS FROM ARTICLES Along with the submitted manuscript, one author, preferably the appropriate author, can provide a working URL from their institutional website, which refers to additional materials such as detailed methods and protocols, materials that can be updated from time to time. Only one URL can be provided by taking the reader to the top-level screen if the materials are on multiple levels. Materials available under this link (a) will not be considered part of the manuscript; b) will not be reviewed; and c) should not be presented with the manuscript. This object is available for manuscripts, where authors believe that additional materials can be useful to readers seeking to reproduce or expand the work. Editors and societies are not responsible for the material they are associated with in this way. The declaration in the manuscript indicating these materials should be included as an endpoint (after all the texts and prior references in the manuscript) in the following format: At the request of the author (s), readers are now warned that additional material related to this manuscript may be found on the institutional website of one of the authors, which at the time of publication they indicate: Insert URL here. These materials are not part of this manuscript and have not been peer-reviewed by Physiological Reports, and editors are not responsible for these materials, for the website address, or for any references to or from it. ONLINE RESOURCES Links to online research articles should always include DOI where possible. When talking about other web pages, it's helpful to include the date you had access to the resource. SUPPORTING MATERIAL Authors are encouraged to submit as supporting material Excel data table, are the basis of their numbers and tables, as well as a short (50-word) description. Please download the spreadsheet (s) (s) submissions as a data file and the inclusion of a summary after confirmations in the main document under the heading Data Files. Other video and audio files (fast time, mpeg, SWF), code, glossary, applications and similar material that cannot actually be published in the article journal can also be presented as additional material for review and publication. Such materials must be submitted for review along with the manuscript and must be consistent with the approval of the editor of the journal. For all additional materials, the authors must include a title for each file explaining the purpose and content of the file. Materials such as numbers, tables, text (such as methods or results), equations, and other materials that can be easily copied and printed on a PDF page cannot be presented as additional material. Such paragraphs should be included in the article as standard numbers or tables, or presented as supporting information only for the purposes of submission and review, not for final publication. ACKNOWLEDGEMENTS Confessions should be minimal in accordance with politeness. Recognition section where you can thank people indirectly involved in the study (e.g. technical assistance; gifts of samples, reagents or cellular lines; credits of equipment or laboratory space; comments or suggestions when creating a manuscript). However, it is important that anyone listed here knows in advance of your recognition of their contribution, as was documented during the submission process. Current addresses of authors (which may differ from those in the line of ownership) can be included here. FUNDS Authors must indicate the source of their funding. List grants, scholarships and donations that have funded (partially or fully) research. However, industry-sponsored grants should be listed in the Disclosure Form submission section. CONFLICT OF INTEREST DISCLOSURE Physiological reports require all authors to disclose any potential sources of conflict of interest in the disclosure statement. Any interests or relationships, financial or otherwise that may be considered to affect the objectivity of the author, are considered as a potential source of conflict of interest. They must be disclosed when directly related or indirectly related to the work that the authors describe in their manuscript. Potential sources of conflict of interest include, but are not limited to, patent or ownership of shares, membership of the company's board of directors, membership of an advisory board or committee for the company, and consultation or receipt of speaker fees from the company. Authors who have commercial associations must claim that they take over responsibility for conducting the trial, have full access to all data and control the decision to publish. Existence of interest does not exclude publication in this journal. If the authors do not have a conflict of interest to declare, they must also state this when submitting. The author concerned is responsible for reviewing this policy with all authors and collectively listing the accompanying letter to the editor-in-chief, in the manuscript and in the online representation system of ALL relevant commercial and other relationships. The aforementioned policy meets the uniform requirements for manuscripts submitted to biomedical journals prepared by the International Committee of Medical Journal Editors. FIGURES figures should be given in the order that they appear. Each figure must have a signature with one sentence. The numbers should not be included in the main document file, but must be downloaded as a separate file or collectively in. Pdf. DOC or. PPT, or as separate files that are not lower than the file size. Illustrations should be prepared for the best possible standard. Please carefully create your illustrations with reference to our graphic recommendations (see . It is very difficult to improve an image that has been saved or created in the wrong format. We understand that not everyone has access to advanced graphics software, so the following information can help if you have difficulty deciding how to get the best of the tools at your disposal. 1. Check out your software options to see if you can save how or export your numbers using one of the industry's reliable standard formats. They will be treated. Encapsulated postscript (EPS) Tagged Image File (TIFF) Portable Network Graphics (PNG) Portable Document Format (PDF) 2. Typically, images containing text and linear works of art (graphs, diagrams, maps, etc.) will be reproduced best if stored as an EPS or PDF. If you choose this option, it's important to remember to insert fonts. This ensures that any text is reproduced exactly as you are going. 3. Images containing photographic information are best preserved as TIFF or PNG, as this ensures that all data is included in the file. SHOULD avoid JPEG (Joint Photo Expert Group) if possible because information is lost during compression; however, it is acceptable for purely photographic subjects if the image was created as JPEG from the beginning (many digital cameras, for example, output only in JPEG format). 4. If you're not sure which format would be the best option, it's always best to default to EPS or PDF, since they will most likely keep the original's high-quality features, as long as the individual file size is not 10 MB. 5. If you can't provide files in your preferred file format, you can send them in the native file format, and we will do our best to work with it. 6. Please make sure that the images have 300 dpi or higher and do not exceed 10MB in file size (all files combined should not exceed 100MB). Graphic AbstractNote: If a graphic abstract is submitted, it should be included during the initial submission or initial transmission to the Physiological Reports. The inclusion of a graphic annotation is not currently mandatory for physiological reports. In addition to the abstract text, the authors can present a graphic abstract-single, concise, informative visual summary of the main findings of the article. It can be used to promote research on social media platforms. Graphic Abstract is a work of art designed to give readers a direct understanding of the paper's core message in a visually appealing way. If possible, the image should be easily readable from left to right or from top to bottom. A graphic abstract should not simply summarize other figures in the manuscript. It is designed to encourage viewing and help readers determine which documents are most relevant to their scientific interests. Graphic abstract should be schematic, demonstrating the mechanistic results of the study (figure, chart, graph, etc.) Be simple, be original - no trademarks or copyright images Use color Read from left to right or top down File name is marked as Graphic Abstract and as a separate file during the online submission presentation
