Let's say you've saved an Instagram story that contains multiple videos on your phone, and you want to combine them into one video to share with your loved ones. It's pretty simple. If you save the videos on your phone, transfer them to your Mac (either using AirDrop, DropBox, Google Drive, Apple/iMessage messages, or email). Save them on your Mac desktop. Let's say the video is called video1.mp4 and video2.mp4. With your Mac open the Terminal app (It's in the Apps --gt; Utilities folder) and enter (or copy/paste) the following commands (click the return key at the end of each line):
cd ~/desktop/cat video1.mp4 video2.mp4 zgt; new_video.mp4
What it does is say the Terminal program to change its desktop workplace. The second line basically says: Concatenate the next two files, in the following order (the files are separated by spaces), and exit/save the final product on a new file called new_video.mp4. Of course, you will need to change video1.mp4 and video2.mp4 to actual file names. For example, it might look like this: a cat VID_1234_8675309_666.mp4 VID_1234_8675309_667.mp4 zgt; new_video.mp4
Keep in mind that there are gaps between the word cat, file names, more than a sign, and a new file name. This is important because the gaps allow the program to know that each team, phrase, and character is different from each other. Happy Contacting! Are you now that quick time on Mac can combine clips together in one combined movie file? The same quick time that is used to watch video on a Mac includes some basic editing features, including the ability to combine multiple video files into one. While most Mac users rely on iMovie or Final Cut to make movie edits and combine videos together, it's just not necessary if all you want to do is combine video clips, and instead you can use the ultra-easy fast playback app instead. You don't get any fancy editing tools or transitions between clips, but if you just need to combine multiple files into one or make a simple video of multiple movie files, a quick time on Mac offers a simple and quick solution. Here's how it works:
How to combine movie files together in Mac OS X with a fast-time player You can combine a lot of individual video clips into one movie using this method: Open the initial video in a quick playback, as usual, from Mac Finder, select and drag the video on top of the already open movie in the quickTime video clip
With the video clips now added, use dedicated clips to organize and rearrange the clips in the movie at will. option you can also crop video clips in a Mac Mac For any of the imported segments as well, but trimming and combining files about the degree of editing you can do in the quickTime Player. This is by far the easiest approach to combining and merging video files on a Mac, and it's easier to use than iMovie, so if you have simple requirements, try this simple solution, it works pretty well. If you know another simple or better solution for combining videos together on a Mac, share in the comments below!

Tip: You can also select the files in Finder and use the Create PDF button in the Finder window preview panel. If you don't see the preview panel on the right, select View and Show Preview. Select version: Select version: macOS Catalina 10.15 macOS Mojave 10.14 macOS High Sierra Change of this management will update this page to automatically combine all or part of two or more PDF into one PDF. WARNING: Changes made to the preview document are saved automatically. If you want to save the original PDF files (in addition to the new combined ones), select the duplicate file to create a copy of each PDF before combining them. Open Preview for Me Thank You for your feedback. There's nothing more frustrating than switching computers or logging in and getting out of multiple Apple iTunes accounts just to access music, videos, and apps you've downloaded as another user or on a new device. There are a number of reasons why one could run into this problem; There may be separate libraries for different family members, you could have more than one computer (say, iMac and MacBook), you could have separate files to work and play, or you could have an iTunes library stored on an external hard drive to free your computer from a 1 billion playlist of songs. Whatever the reason, I'll show you how to solve this problem so that your technology can do what it was built to do: make your life easier. Export Options - Import Method: For this method you will need to export your library from the first computer (or user as it may be) and import it to the second computer as the final destination. Many people can offer simply copying and ingosing iTunes media files which is good if you just want a simple song, video or pod thrown, but you should be warned that you will lose all your metadata (read: playlists, ratings, play count) if you decide to go down this path. If you've spent your whole life evaluating all your and video or use the most played playlist that iTunes automates for you, you'll be unhappy to see all this information disappear. Fortunately, there is a method of merging your iTunes library without losing metadata. Pros: This method is completely free. Metadata will be transmitted with your music. Cons: The process can be intimidating for some users. Problems can occur with the location of files when transferring between the PC and the Mac. If you combine libraries with individual computers, you'll need a way to transfer files between them. Your options include: Connect two computers with Ethernet. Save files on an external hard drive/USB drive/DVD. To begin with, I recommend making sure that all the media files from both libraries that you combine are in the right folders. 1. Go to iTunes. If you add to your library, select the Keep iTunes Media folder and copy the files to your iTunes Media folder. Choose OK. You will also need to organize your own libraries that will make sure that each of your movies, songs, etc. is stored the way your new iTunes library will expect them to be. 2. Go to the library file. Choose how to consolidate files and reorganize files in the 'iTunes Music' folder. If you can't choose to reorganize files in the 'iTunes Music' folder, that means your computer has already done so. Choose OK. Next you want to make sure that all your file types are being exported. 3. Go to iTunes. Make sure all the types of files you would like to export are checked, such as movies, TV shows, podcasts, iTunes U, etc. Select OK. Now it's time to go through the actual export. This will create an XML file that contains a playlist and a rating of information about each of your songs, videos, etc. In order not to be so confusing, I will be referring to the computer or the user from whom you move the library from Computer A and the computer to which you merge two libraries, like Computer B. Use Step 4 to complete the transmission. 4. Share your computer's hard drive A. In iTunes on your B computer go to file-zgt:Add to the library. Go to the music-iTunes folder on your computer's hard drive A. Select a file ending at .xml (in my case, iTunes Music Library.xml) and click Open. All media files (music, video, etc.) and important data go to computer B. If you transfer music from an external hard drive (EHD), you need to first export your computer A library to EHD and then import it from EHD to PC B. Use steps 5 and 6 to complete the transmission. 5. Connect the external hard drive (EHD) to your computer A. Where the location of the iTunes Media folder is written, select Change. Select (or create) a folder on EHD and select Open. Go to the Librari Export Library. Go to EHD and select Save. Now that your computer's A library has been successfully stored on EHD, you need to import it to iTunes of B. 6. Connect the external hard drive (EHD) to your iTunes computer. Go to EHD and select the file you just saved there ending at .xml. Click open. Here it is. You've combined your library for FREE! However, if you're among those who choose to pay to merge iTunes libraries, you have another method that you could use. There are a number of programs that can do the job for you. Program Options: PowerTunes Syncopation MyTuneSync TuneRanger PowerTunes seemed to be a more recommended program among Mac forum users, but with a \$20 price tag you might be more interested in it for some other features (such as doing the opposite and creating multiple libraries). And here it is! Regardless of your choice of method, you should be the proud owner of one beautiful iTunes library with all your media in one place. After spending over 20 years working with a Mac, both old and new, there's a tool I think would be useful for every Mac owner who is experiencing performance problems. CleanMyMac is the highest rated all-around cleaning app for mac, it can quickly diagnose and solve a plethora of common (but sometimes tediously fix) problems at the touch of a button. It's also just going to address the many issues covered in this site's acceleration section, so download CleanMyMac to get your Mac back up to speed today. Today.
