The Toyota Way is a set of principles and behaviors that underpin The management approach of Toyota Motor Corporation and the production system. Toyota first summed up its philosophy, values and manufacturing ideals in 2001, calling it Toyota 2001. It consists of principles in two key areas: continuous improvement and respect for 14 Principles3 Inherited findingsIntivity plays an important role in many organizational theories, such as resource dependency theory and the economics of transactional costs. Long-term philosophyRight process will produce the right resultsAdd value for the organization by developing its peopleContinue fundamental problems drives organizational learning2 focal points of principles of continuous improvement and respect for people. Principles of continuous improvement include long-term vision, challenge work, constant innovation and the transition to the source of a problem or problem. Principles of respect for people include ways to strengthen respect and teamwork. The system can be summarized in 14 principles. The principles of these are described and summarized below. Principle 1Base your management decisions on long-term philosophy, even to the detriment of short-term financial goals. People need a goal to find motivation and set goals. Principle 2Crea the continuous flow process to bring the problem to the surface. Workflows are redesigned to eliminate waste (mud) during continuous - kaizen. Seven types of mud mud (time at hand) Unnecessary transportation or transportation Processing or incorrect processingExcess inventoryMotionDefectsPrinciple 3Exuse pull system to avoid overproduction. A method by which the process signals to its predecessor that more material is needed. The attraction system produces only the necessary material after the subsequent operation signals the need for it. Principle 4Arth of workload (heijunka). (Work like a turtle, not a hare). Ford diagnostic software download for free. This helps to achieve the goal of minimizing waste (mud) rather than overloading people or equipment (muri) rather than creating uneven production levels (mura). Principle 5Stified the culture of stopping to fix problems to get the quality right the first time. The quality takes precedence (Jidoka). Any employee in toya Production System has the right to stop the process to signal a quality issue. Principle 6 Standardized tasks and processes are the basis for continuous improvement and empowerment of employees. Although Toyota has a bureaucratic system, the way it is implemented allows continuous improvement (kaizen) from people affected by this system. This gives the employee an opportunity to help in the growth and improvement of the company. Principle 7Uz visual control, so no problems are hidden. This principle includes the 5S program - steps that are used to make all jobs efficient and productive, to help people share workstations, reduce the time it takes to find the right tools, and improve the work environment. Grow leaders who thoroughly understand the work, live philosophy and teach it to others. Without constant attention, these principles will disappear. Principles need to be ingrained, it has to be the way anyone thinks. Employees must be educated and trained: they must support the training organization. Principle 10Development of exceptional people and teams that follow the philosophy of your company. Teams must consist of 4-5 people and numerous management levels. Success depends on the team, not on the individual. Principle 11Respect your extended network of partners and suppliers by challenging them and helping them improve. Toyota treats suppliers the same way they treat their employees, challenging them to do better and helping them achieve this. Toyota provides cross functional groups to help suppliers detect and fix problems so they can become a stronger, better supplier. Principle 12Go and look at yourself to thoroughly understand the situation (Genchi Genbutsu). Toyota managers are expected to go-and-see operations. Without first-hand experience of the situation, managers will not have an understanding of how it can be improved. In addition, managers use Tadashi Yamashima (President, Toyota Technical Center (TTC)) ten management principles as a guideline: Always keep in mind the final goal. Obviously assign tasks to yourself and others. Think and talk about proven, verified information and data. Use the full wisdom and experience of others to send, gather or discuss information. Share your information with others in a timely manner. Always report, inform and consult in a timely manner. Analyze and understand the flaws in your capabilities in a measurable way. Relentlessly strive for caisen activities. Think outside the box or outside of common sense and standard rules. Always be aware of the safety and safety of your health. Principle 13Make solutions are slowly consensual, carefully considering all options; (nemawashi). Here are the solution options: Find what's really going (go and see) to check the root cause of The Consider's wide range of alternatives to the Consensus Order on resolutionUse effective communication toolsPrinciple 14Become training organization through relentless reflection (hansel) and continuous improvement (kaizen). The process of becoming an educational organization involves criticizing every aspect of what one does. A common method of solving a problem to determine the root cause of the problem includes: The initial problem perceptionClarify problemLocate area / cause pointInvestigate root causes (5 whys)CountermeasureEvaluateStandardizeIn 2004, Dr. Jeffrey Liker, University of Michigan Industrial Engineering, published by Toyota Way. In his book, Liker calls the Toyota Way system designed to provide tools for to constantly improve their work. According to Liker, the 14 principles of Toyota Way are organized in four sections: (1) long-term philosophy, (2) the right process will give the right results, (3) add value to the organization by developing its people, and (4) continuous solution to root problems drives organizational learning. The first principle involves management with long-term rather than short-term gain. It reflects the belief that people need a goal to find motivation and set goals. The following seven principles are focused on the process with an eye to quality results. Following these principles, workflows are recycled to eliminate waste (mud) in the process of continuous improvement - kaizen. Seven types of mud are (1) overproduction; (2) waiting, time at hand; (3) unnecessary transport or transportation; (4) Recycling or incorrect processing; (5) excess inventory; (6) movement; and (7) defects. Principles in this section empower employees, despite Toyota's bureaucratic processes, as any employee in Toyota Production System has the right to stop production to signal the issue of quality, emphasizing that quality takes precedence (Jidoka). The way Toyota's bureaucratic system is implemented to ensure continuous improvement (kaizen) from people affected by this system, so that any employee can help in the growth and improvement of the company. Recognition of the value of workers is also part of the principle of measured production speed (heijunka), as the level of workload helps to avoid overloading people and equipment (muri), but it is also designed to minimize waste (mud) and avoid uneven production (mura). These principles are also designed to ensure the use of only basic materials (to avoid overproduction), effective compliance with working conditions (5S program) to help people share workstations and reduce the time it takes to find the necessary tools, and to ensure that the technology used is reliable and thoroughly tested. Human development is the focus of principles 9-11. Principle 9 emphasizes the need to ensure that leaders embrace and promote corporate philosophy. This reflects, according to Liker, the belief that principles must be ingrained in employees to survive. The 10th principle emphasizes the need for individuals and working groups to adopt the philosophy of the company, with teams of 4-5 people who judge the success of their team achievement rather than their individual efforts. Principle 11 looks at business partners who treat Toyota the same way they treat their employees. Toyota challenges them to do better and helps them achieve this by providing cross functional teams to help suppliers detect and fix problems, they could become a stronger, better supplier. The final principles cover the philosophy of problem-solving, problems, careful understanding based on consensus solutions are quickly implemented and constant reflection (hansel) and improvement (kaizen). In the 12th principle (Genchi Genbutsu) sets out the expectation that managers will personally evaluate operations so that they can understand situations and problems firsthand. Principle 13 encourages careful consideration of possible solutions through a consensual process, with the rapid implementation of decisions once achieved (nemawashi). The final principle requires Toyota to be a training organization by constantly reflecting on its practices and striving for improvement. According to Liker, the process of becoming a learning organization involves criticizing every aspect of what one does. There is a question of takeover principles now that Toyota has manufacturing operations in many countries around the world. As noted in a New York Times article, while corporate culture may have been easily spread by word of mouth when Toyota's production was only in Japan, with global production, many different cultures need to be taken into account. Concepts such as mutual responsibility for problems, or genchi genbutsu (solving problems at source rather than at tables), and kaizen mind, (endless sense of crisis for the company's constant desire for improvement), may be unfamiliar to North Americans and people of other cultures. The recent increase in recalls may be due in part to Toyota's inability to spread its obsession with craftsmanship among its growing ranks of overseas factory workers and managers. Toyota is trying to address these needs by establishing educational institutions in the United States and Thailand. The Toyota Way has been driven so deep into the psyche of employees at all levels that it has evolved from a strategy into an important element of the company's culture. According to Masaki Sarut, author of several books about Toyota, the real Toyota Path is a culture of control. Toyota Way rewards the company's intense loyalty, which at the same time invariably reduces the voice of those who challenge the authorities. Toyota's constructive critique of achieving a better way of doing things is not always accepted in a good mood at home. The automaker's approach to driving the Toyota Way worked until it happened. One consequence of this was that Toyota had received reports of a sudden acceleration of its vehicles and the company was faced with a potential recall situation. There were questions if Toyota's crisis was caused by the company overlooking its own principles. Toyota Way in this case did not solve the problem and learn the direction of what the automaker would do, but managers instead defended the company and issued a flat-out bounce and laid the blame on others. The consequences of the carmaker's actions led to 2009-11 The car recalls. While one of Toyota Way's principles is to build a stop-stop culture to fix problems to get quality right for the first time, Akio Toyoda, president and CEO, said during congressional hearings that the reason for the problems was that his company was growing too fast. Toyota's management has determined that its goal is to become the world's largest car manufacturer. According to some management consultants, when the pursuit of growth was a priority, the automaker lost sight of the core values that gave it a reputation in the first place.
