It can send contacts, messages, call history, photos, calendars, and more. Even so, some unique data, such as Safari bookmarks, will not be transferred to your Android. iCloud syncs your iPhone's photos using its Photo Stream feature, but like everything else, it also has some limitations. For example, what you may not even know about is that it has a limited storage window of 1000 images i.e. only the last 1000 images are synchronized with your iPhone with your iCloud amount i.e. the fact that you can have over 1000 images to be backed up (imagine removing some, thinking they had to reach looking up; about horror!). A The advantage is that it offers users only 5GB of free storage, which can flow out quite quickly. So you can switch platforms and try an Android device where all this data has to be transferred to new Android devices. You can always transfer your iCloud photos to your Android using the popular but long method of incorporating iCloud photos into your iPhone, copying images from your iPhone to your computer via a USB cable, connecting your target Android phone to your computer via a USB cable, and then copying the images again from your computer to your Android phone. As if all this connection and copying wasn't enough, you might even have to download software to convert the type of data and what not. No, it doesn't end here, there are a lot of risks associated with all these processes as spoiling it won't require any effort at all. I don't know about you, but someone who loves it easily certainly doesn't like the sound of all this hard work.
