Mitchell White It can be helpful to turn an audio file into a video file when you want to upload music to a website that only accepts video files such as Youtube. By adding an image to the song, you can create a file in video format that you should be able to upload to your video streaming website. You can use your hometown Windows Movie Maker program to do so. Open Windows Movie Maker. Go to the File menu and select Imports in the collection. A viewing window will appear. Double tap the audio file to add it to the Collection box. Repeat the process with the image file to add the image to the box as well. Click on the MP3 file in the collection box and drag it to where Audio is written. Drag the photo to where the video is written. Click on the File menu and save the new video. Linux users: Getting videos into an iPod compatible MP4 format has never been easier. After installing ffmpeg and ruby, Ubuntu Unleashed Blog demonstrates how you can add a entry to the right click menu in Nautilus, which will automatically convert the video into a format that you can enjoy on the iPod video. The conversion is done with an easy-to-use script. The installation process is very short and you should be running in less than two minutes. If you've ever created a complex Word document, you've probably encountered those frustrating problems when you just can't seem to get a bullet point or a paragraph of text aligned correctly or some text continues to break into another page when you need it to be on the same page. In order to fix these types of problems, you sometimes have to manually edit the formatting of the document. In Word, the text of the document is stored separately from formatting. This is good because it makes it easier to edit formatting without losing text. In this article, I'll tell you how to display formatting marks in Word documents. These formatting signs include tabs, hyphens, spaces, paragraph marks, hidden text, page breaks, etc. I'll also be talking about another feature in Word called Show Formating that lets you see all the formatting applied to any selected text. Show Sign Formats There are two ways to go about showing formatting or item marks in word: either using a button on a tape item or going to Word - Settings. The latter method will display formatting marks all the time for all documents. Using the button, you can switch the display of the signs, and this only affects the documents currently open. To view paragraph marks in Word, click on the Home tab in the feed, and then click on the paragraph mark in the Paragraph section. As an example, here I have text in Word with basic formatting: Now, if I press the button above, I immediately see all the formatting signs in the document. Lines with an arrow pointing to the right are tabs, and individual points are spaces. The hidden text is highlighted by a dotted line, and the page break appears at the bottom. If you want to display any particular formatting sign all the time, you can do so by clicking on the file and then the settings. Now click on the display in the left menu and you'll see a section called Always Show These Format signs on the screen. At the bottom list, you can also show all the formatting signs too, if you like. Now let's talk about the formatting option to reveal in Word. Show Formating In addition to viewing paragraphs and formatting characters in Word document, it's sometimes helpful to see which ones applied to the text. It's a bit like HTML and CSS if you're familiar with these web protocols. In order to reveal formatting in Word, just click SHIFT and F1 and the dialog box will appear docked to the right side of the screen. Now just click anywhere on the document or select the text and you can see all the formatting applied including font, language, effects, etc. it will also tell you the formatting applies to the paragraph and section. This is really useful if you need to see exactly what formatting was used to get a specific look at some text. It's also worth noting that the blue links in the dialogue are interactive. Let's say you want to change the font, just click on FONT and it will bring up the font dialogue. The same goes for effects, alignment, indentations, intervals, fields, etc. These are almost all ways to edit the formatting or formatting of the view in the Word document.
