The Android 7.1 update has arrived in developer preview form for anyone with the Nexus 6P, Nexus 5X or Pixel C and the desire to try it out. Among the rather short list of new Android 7.1 Nougat features is a new tool in settings called Storage Management, which is worth mentioning. Storage management is, as you suspect, a storage manager. It appears in the Settings Warehouse section and provides you with two options: manually freeing up space or turning on Smart Storage. While you can just sound like an automatic version of another, they actually do different things and work well in concert with each other. Smart StorageSmart Storage is essentially a Google Photos tie-in that automates the free space option in this app. Turning on Smart Storage will automatically delete photos and videos from your device every 30, 60 or 90 days, but only after they've been backed up to the cloud in Google Photos.It a simple option that saves you from constantly agreeing to photos to quickly make room when your storage device is running low. But Smart Storage doesn't automate all Android 7.1 storage solutions. There's also a manual tool for cleaning the space that works well, as well as an addition to Smart Storage.Manual CleaningS will find a manual cleaning tool in the settings of the zgt; storage management, as well as in the overflow storage section menu. Clicking the Free Space button creates a list of potential items to remove in several categories including photos and videos, downloads and apps. You can include or exclude any of these categories through checkboxes and expand them to delve into the list of downloads or apps. Simply select the files or apps you want to delete and click the free space button. After removing some of the content, you'll be asked to turn on Smart Storage, which you can choose if you haven't already. This storage optimization tool is just another one of the many small additions in Nougat that really start the amount. Obviously, the focus is on automating tasks in Nougat, from seamless updates to prioritizing notifications to on-the-go mode. Storage management is another way to improve your experience while providing you with fine-grained control. What is your favorite Nougat feature? What is Nug still missing? We don't live in an age where having cloud storage is a good idea. It's effective, won't take your internal storage, and it's much more convenient than wearing a hard drive everywhere. It also makes it easier to access files with other people. You can get ahead of the curve with these amazing cloud storage services and Android apps! also some great free cloud storage apps here that don't cost you anything! Prices are accurate by publication date, but they can change! Amazon DriveAutosyncBoxDropboxGoogle DriveAutosyncBoxDropboxGoogle OneDriveNextcloudResilio SyncTresoritPrice: Free app /\$12-\$60 per yearAmazon Drive is a good start for those who use Amazon Prime. Those with Amazon Prime already get 5GB of free storage along with unlimited backups for photos and videos. You can upgrade to unlimited storage for about \$60 a year. Those without Amazon Prime get unlimited backup photos for \$12 a year. The app itself works normally and is not something special. There is a bit of lag at times, but otherwise it is a decent overall experience. AutosyncPrice: Free / Up to \$9.99Autosync is a family of MetaCtrl applications. Each one deals with a different cloud storage app, and you can choose between Google Drive, OneDrive, Dropbox, Box, MEGA, and the new universal (still in beta), which works with all previously mentioned services along with pCloud, Yandex Drive, and SharePoint Online. Autosync acts as a cloud storage manager. This forces a complete two-way synchronization between your phone and cloud storage (or one way, if you prefer), and you can set it to sync at customized intervals. That's really all it does, but it's great if you want a copy of your cloud storage on all your devices. There are many free cloud storage providers available, although not all of them are the same. They differ from each other in terms of the features and free space they offer. Read more: Best Cloud... BoxPrice: Free/\$5-\$15 per month/OptionsBox.com that is and is wanting in the cloud storage world. There are a number of file management apps and others that have Box integration as well and that's a good thing. New users can subscribe to personal accounts for free and get 10GB of free storage while \$10/month gets you 100GB. Business prices range from \$5-\$15 per month per user and include a lot more features. The app works very well and it puts an emphasis on simplicity and organization. Unfortunately, those who need more than 100GB may need to shop elsewhere. DropboxPrice: Free/\$9.99-\$19.99 per month Everyone knows about Dropbox and there's a good chance that some of you have this app pre-installed on your devices already. The app comes with automatic photo uploading, simple sharing options, the latest Android design elements, Microsoft Office support, and the ability to send files to other users. This is a very solid option with more features than most. Individual accounts get 2GB free with options for 1TB for \$9.99 per month along with a \$19.99 option that provides the same space but with more Business users have other options available, contact Dropbox.Google DrivePrice: Free/\$1.99-\$99.99 per month Google Drive is one of the most respected and popular cloud storage apps available. Users get 15GB free out of the gate with unlimited photos and videos back up via Google Photos if they want to (with proper quality settings). There is also an assortment of office app applications for documents, notes, spreadsheets and presentations. You can upgrade to 100 GB (\$1.99/month) or 1TB (\$9.99) for pretty cheap, and there is an option for 10TB as well (\$99.99 per month). The office application and cloud storage combo is powerful and one that competitors have a hard time beating. MEGAPrice: Free / 4.99 - 29.99 euros per monthMega is a continuation of the now defunct Megaupload, a cloud storage service that was shot down by the authorities a couple of years ago. Mega is an up-and-coming service that gives users 50GB for free. This is the biggest bonus we've seen of all these cloud and storage apps. It comes with a number of storage options that cover between 200GB and 8TB. The app is pretty flashy but a few bugs here and there that some people have experienced. Its biggest feature is that it encrypts all the files uploaded to it for extra security and protection. Microsoft OneDrivePrice: Free/\$1.99-\$9.99 per monthMicrosoft OneDrive is a popular cloud storage option because it integrates directly with various Windows products. For starters, you can get 5GB of free cloud storage, and you can upgrade to 50GB for \$1.99 per month. OneDrive storage is also included in every Office 365 subscription, whether for personal use or for business. You can get a package complete with OneDrive Space and Microsoft Office 365 for \$6.99 per month (1TB, one device) or \$9.99 per month (5TB, five devices). This gives you Microsoft Office and online cloud storage space for an exceptionally reasonable price. NextcloudPrice: FreeNextcloud is a different type of cloud storage. It works just like Resilio Sync. You create your own Nextcloud server on your own computer. The app allows you to sync files between your computer and your phone. It works just like your typical cloud storage, but you control where the files are going and what happens when they get there. It's a great resource for people who like the idea of cloud storage but don't want their files on the servers of any other company. Plus, you get as much cloud storage as you have storage on your computer. Free to use for personal use. There are business options for the business as well. Resilio SyncPrice: Free / VariesResilio Sync (formerly BitTorrent Sync) is the best cloud storage solution for anyone who wants to make their own cloud storage. This app allows you to use your desktop, laptop, NAS, tablet, or even your own home server as a place to sync your phone. It works just like Dropbox, Google Drive, etc. except you'll use your own to store everything. This is a great option for those who have conscious security, but still need cloud storage as well. The only downside is that you will need to keep your receiving machine at all times, so that synchronization can be done. The app is free for basic home use with some pretty expensive expensive if you want to get full functionality. However, it is a single payment, so it is still cheaper in the long run. TresoritPrice: Free/\$12.50-\$30 per monthTresorit is one of the new and more expensive cloud storage options. However, it takes security very seriously. It has full encryption of every file uploaded to its service. Basic accounts receive 1GB of storage. \$12.50 a month earns you 200GB while \$30 a month nets you 2TB. In addition, pro plans include far more security features than a free account. There are also additional options for business and corporate use. This is a strong option for those who don't mind paying for it. Who do you use for cloud storage? If we missed any other great options for Android cloud storage let us know about them in the comments below! Source: Joe Maring/Android Central When Android 10 was back in the early beta days, Google had plans for big changes in how apps can access files and folders in your phone's external storage (things like photos that you or other apps placed in/data/media folders, not the SD cards present in many Android models). This change was known as Scoped Storage, and its purpose was to kill the abuse of READ_EXTERNAL_STORAGE permissions that so many applications and developers would like to request. These changes were originally planned to apply to each app on a phone running Android 10 or later, but due to a developer's reaction Google changed course and required the use of only Scoped Storage for applications that target Android Level 29 API, which is Android 10. But with Android 11 Scoped Storage is back, and Google is unlikely to change its mind this time. Top 10 features in Android 11 you need to know about right now How Scoped Storage works Source: Android Central At one time Android worked like any other desktop operating system when it came to accessing files; things like documents, photos, music or anything else you wanted to store on your device were there for any other app to open. You said it was ok for the app to do it when you installed it and it just did. Using the app's home user interface, you can browse the file system and view all public files. With Android 4.4 KitKat, Google began to make changes and add restrictions on how the app can access files it doesn't own, and with Android 5.1, the storage access framework has been implemented. This gave apps the ability to access files in other folders using the Android API instead of using standard programming file. This is... It's working. It's slow and pretty unpopular, but it's available, and by now almost every app developer that needs this kind of global access has at least tried it to see how fit it is or not based on their needs. With Scoped Storage, things are becoming more restrictive and easier at the same time. The compatible app gets its own folder for user data. Data. There is already a private folder with a sandbox to store the required files, and it is not available for any other application. Think of the app as a voice recorder, for example; he needs somewhere to store the audio files he creates. The app doesn't need permission to read or write any file in this folder, so you're not asked to provide any permission when you first run it regarding file reading and place recordings; apps also need permission for every folder they want to access but don't own. Developers who need access to folders that don't belong to their app will need to use Storage Access APIs. This means that he must request an API to see if the files exist and get his device location and then ask the user for permission to use it. This was the recommended best practice for accessing files with Android Lollipop, so it's not entirely new. But with Scoped Storage, it is now strictly enforced and no longer optional. Why make this change? Source: Google's YouTube gives two good reasons why it makes this change: security and reduce the remnants of the app clutter. On the security front, this change does a few things. First of all, it allows the developer to have their own storage space in your device, which is private without asking for any

specific permissions at the first launch. And no other application can access any document it creates without saying it's possible. Second, just as importantly, it reduces the abuse of READ_EXTERNAL_STORAGE permission. When you grant this permission to the app today, it gives you access to all external storage, where we save for things like photos, personal documents, videos, and other potentially sensitive files. When Scoped is forcibly stored, apps can only see their own data folders, as well as some types of media, such as music files, using other storage APIs. These APIs can provide access to view, record, delete, and even voluminous activities with a user's hint built into the system that allows you to allow or deny action. These APIs should make it easier to develop for applications such as music players or photo editors, even without forced Scoped storage. Reducing the clutter of the application requires a small explanation. When you delete the app, the files and folders it falls all over the device's storage as soon as you have given it permission to stay behind. A sufficient number of these residues can start to affect performance, especially if the files use a common name that can be repeated by another application. For example, if a developer a media-creating app, such as a camera app or a music voice recorder, he or she can use the standard locations of the media folder to deposit things you create so they aren't removed if the app isn't blocked. What about file managers? Source: YouTube App Developers such as File Managers who want to access every file in the external store can do through the framework of access to storage, once issue a google permit - we learned in October 2019 at the Summit of Android Developers that a program allowing special access is being carried out. The user will give permission to the file manager's app to access the root (top-level folder) of the external store, thereby providing recursive access to each folder and file inside it. Since it's quite a wide choice and one of scoped Storage's goals is to reign in apps that want this level of access, it's good that Google will take a special look at apps that want to do so and provide permission for legitimate applications like your favorite file manager. Storage will happen this time Source: Joe Marin/Android Central Early Feedback for Scoped Storage wasn't very good. There was even a petition that asked Google to remove the feature to rethink its implementation. Which is basically what Google did. The storage area was available in the official release of Android 10, but the developers were not required to use it. But that's all about to change. From the Android Developers website. Any app that is designed for Android 11 or later must use new storage APIs, including Scoped Storage. Changes to the Google Play developer agreement say that from August 1, 2020, all new apps introduced in Google Play must be targeted at Android 10 or later, and all updates to existing apps must be targeted at Android 10 or later starting November 1, 2020. Expect the same behavior and next year's app will probably need to target Android 11. This means that if the app developer is not prepared to let the app wither and die in a sea of older applications, Scoped Storage should be implemented soon. Fortunately, this time Google has listened to reviews and made things easier for apps that have a need for full or special access and new APIs in Android 11 to make other things easier, too. A safer and safer Android is something we should all want.
