This saves paper and twice as many printed documents for carrying. It's pretty simple: If the printer naturally displays the pages in the right order (usually for laser printers that are given sheets in a face down heap). Print only even pages, print in reverse order. Put a stack of printed paper back in a tray of fresh paper. Print only the odd measureded pages, print in the usual way. If the printer naturally displays pages in reverse order (usually for ink inkjet printers that give out sheets in a pile face up). Print only other dead pages, print in the usual way. Put a stack of printed paper back in a tray of fresh paper. Print only the odd measureded pages, print in reverse order. If the number of pages in total is strange, be sure to put a blank sheet on the end after printing an even number of pages to give something for the final odd print page on the back. Getting the paper the right way round the only tricky bit becomes the paper in the right direction when putting it back in. The right way up will depend on the particular printer. Most small laser printers these days take the paper out of a fresh paper tray at the bottom, served in a short edge first, print on it starting from the top page, flip it from top to bottom and spew it over a fresh paper tray. For them, put the on side of the printed paper back in a fresh tray of paper face down from the top of the page, pointing to the printer. Most cheap inkjet printers these days take paper from a fresh paper tray at the top, served at a short edge first, print on it, starting at the top of the page, and spew it down in front of the printer. For them, also put the no side of the printed paper back into a fresh tray of paper face down from the top of the page pointing to the printer. Anyway, it only needs testing once for the printer, there are only 4 possibilities for testing and the sheets of paper consumed in testing will be immediately compensated by the first pages of the double-sided printing. What if the odd/even Page Printing numbers are not available Unfortunately, at least in Microsoft Windows 2k, printing is just odd or just an even page is not part of the operating system or the main printer driver, but specific to each application, such as Microsoft Word 2k and Open Office 2 there, but Notepad 5 and Internet 6 are not. Here are some workarounds that may be worth trying: If the app's print dialogue contains the ability to print a selection of pages, just put 1,3,5,7, etc. in If you need a list of the top thousand page numbers divided into odd and even commas divided lists for convenience, here they are: odd numbers; even numbers. 2. Convert it to PDF. I read but did not check that acrobat Reader 8.1 8.1 the ability to print the odd and even pages separately. 3. Alternatively show the navigation panel in the Acrobat Reader, flash the sketches so exactly 2 columns fit in and drag select the entire one column then print out that selection. Problems There may be some risk of interference (but it's just from not neatly restacking the paper before you put it back in), sticking out (let the laser printer ink cool before feeding the paper back in) or water-soluble ink jet ink soaking through the paper and dissolving the ink on the other side (but if your printer does it, there's a problem that will be cured anyway before spending too much expensive ink!). It's a hassle to keep putting the paper back in for short documents (especially because it gets confusing if you queue a lot of documents in the printing queue or that quickly close or edit the document after sending to the printer), but for larger documents, I find it more of a hassle to carry around (or find a place to file) twice as much paper as it needs afterwards. I got a suggestion of an improved order that you don't need to remember an extra blank sheet when the number of pages is strange: print the odd numbered pages in reverse order, put the paper back in a fresh tray of paper and print out even numbered pages in normal order. However, this creates a variety of inconveniences: the sheets must be individually included as they come in the order of page 2, 1; 4, 3; 6, 5, etc. 'Manual Duplex' Printers Some one-way printers are advertised as doing two-way printing on a manual duplex. This is essentially the same as the method described above in this article, but separating from the odd and even pages built into the printer or printer driver for convenience. If the printer has it, then it is probably easier to use it because it will not need you to find a program capable of odd /even sharing the print, should automatically add a blank terminal to even a page if necessary, and a way to organize the paper to return should be specified in the instructions or on the printer itself. Adobe Reader and Adobe Acrobat allow you to print two-way if the printer supports this feature. The printer driver controls the options, not Adobe Acrobat or Adobe Reader. Check the printer's documentation to see what features the printer supports. (A two-way seal is also called a duplex, back-to-back, front and back, or two-way printing.) Currently, macOS print settings take precedence over Acrobat or Acrobat Reader print settings. When you try to print a two-way version of Acrobat or Acrobat Reader, the printer is not printed according to the specified settings in Acrobat/Reader. So you have to set up the print settings with CUPS administrator interface in Mac. CUPS (formerly known as the UNIX General Printing System) is a network printing service used by Mac computers. This allows you to set up network and set up the printer settings. By default, the CUPS web interface is disabled on the Mac. Note: The settings in the CUPS interface redefine print settings in Acrobat or Acrobat Reader. Open the Terminal app on your Mac. To open the Terminal, do one of the following: Tap the Finder icon in the dock. Click Go're-gt. Open terminal. In the top left menu on the Mac, click the Spotlight icon and enter the Terminal. Open terminal. On request, enter sudo cupsctl WebInterface=yes and click Return Enter your Mac password on demand and click Return. Open Safari or any other browser, and in the address rack and click Return. The CUPS web page is displayed. Go to the Printers tab and select a printer from the list. In the list of administrators, selecting the default set settings. To enable two-way printing, select Long-Edge Binding or Short-Edge Binding for a two-way version. To disable the two-way seal, select Off. To save the changes, click Set the default settings. Now the printer is set up. Open the PDF in acrobat or acrobat Reader and print out the PDF. (Reader X/Acrobat X) Click the printer button at the bottom of the Print dialog and then press Yes when asked. Make sure the Print dialog is in extended mode by clicking on the arrow to the right of the Printer pop-up menu. In the Print dialog field, select Layout from the pop-up menu. The Print dialog with Layout is selected from the pop-up mode menu. A long binding is selected from the two-way pop-up menu. From a two-way pop-up menu, choose the optional option. Click Print and then click OK from the main print dialogue window. In Acrobat or Reader, select Print. Choose a print on both sides of the paper in the printer's dialogue. In Acrobat or Reader, select the Print File. Click on the Layout tab. This dialogue changes the printer to the printer. It is possible that your dialogue does not correspond to the dialog windows shown below. Make a choice from print on both sides of the glass. Depending on the printer driver, this panel can be called a two-way print or a similar name. If you don't see the print on the panel on both sides, the printer you're looking for doesn't support duplex printing. Or the function is off (see Check that the functions of the printer are included). Click OK and then click OK again for printing. If you don't see a two-way version, it's possible that the feature isn't on. Select the printers and faxes (Windows XP) or the devices and printers (Windows 7). Tap the right button of the printer and select Print Preferences. Expand the parameters of the documents to the functions of the printer. Choose the right options and then select On from the pop-up menu. If you don't find duplex printing and flattening in the options, the chosen doesn't support these features. Click OK and then click OK again to get out of the dialog box. Window. The printer does not support two-way printing, you can manually print the document with both sides of the paper. Steps vary depending on how the printer transmits and displays the pages. Print a few test pages according to the instructions to understand how to feed the page back to the printer. Follow these instructions if the printer puts the pages in numerical order (starting with the first page). Pages come face down from the printer (usually with laser printers). From subset's pop-up menu in the print range, select only Even Pages. Select The Reverse Pages option. In this scenario, the Reverse Pages option ensures that the page sequence is correct. If the total number of pages is strange, add a blank sheet so that the last odd page has a print sheet. Put a stack of printed paper back in a tray of power paper (source) so that the unprintable sides are printed. Bring the top of the pages to the printer. Make sure the edges of the paper stack are square. Select the print file and select the odd page only from the Subset menu. (Don't select Reverse Pages this time.) Follow these instructions if the printer displays the pages in reverse order (last page first). Pages come out of the printer face up (usually with inkjet printers). From the Subset pop-up menu in the print range, select only the pages you want. If the total number of pages is strange, add a blank sheet so that the last odd page has a print sheet. Put a stack of printed paper back in a tray of power paper (source) so that the unprintable sides are printed. Bring the top of the pages to the printer. Make sure the edges of the paper stack are square. Select the print file and select the odd page only from the Subset menu. Select The Reverse Pages option. In this scenario, the Reverse Pages option ensures that the page sequence is correct.
