## Global winds worksheet middle school

Wind Notes: From the slides above:Set:- Convection Cell- Wind- Coriolis Effect- Doldrums- Trade Winds- Horse Latitudes- Prevailing Westerlies- Polar EasterliesWrite and Answer:- How are winds named?- Which winds affect the weather in the U.S.? - What's the jet stream? How does that affect the weather? Compare/Contrast:- Sea Breeze/Dry Wind - Wind Valley/Breeze Picked Animations of Winds: Location of global winds with Coriolis effect included animated Coriolis effect: Upper circle - looking up, lower circle - looking from the side.... wind\_foldable.pdfFile Size: 166 kbFile Type: pdf Download Wind File Folds Directions: See pdf file above if you get really stuck! Take two sheets of notebook paper and a smart half-length cut. Drop one of the halves so you have three long sheets. Put the three papers on top of each other. Slide the papers so they symther and there's about one inch between each one. In the middle of the stack, fold the papers below so that each tab is about 2.5 cm wide. Clamping in your inverse head. Cut and paste the world map on the top tab. Fill in the general wind patterns and tag it using the following colors. Use the same color when writing the ghost name on tab.doldrums - redtradewinds - orange horse width - yellow westerlies - green polar orientals - blue arrowsDraw using a black pencil to show the direction of wind movement from the Coriolis effect.On the tabs above each term, give a detailed description of the spirit, using the information below. Global Wind Information:\* Doldrums: This is the very low pressure zone along the equator where prevailing winds are calmest. This low pressure zone is caused by constant heating of the sun. This belt extends 5° north and south of the equator and is where the trade winds coming from the south and north meet.\* Trade winds: This is the belt that extends up to 30° north and south of the intertropical convergence area (ITCZ). It's hot, steady winds blowing almost continuously. \* Horse width: The horse's latitudes are located about 30 degrees north and south of the equator, between the trade winds and the prevailing westerns. This is an area of high pressure with calm winds, sunny sky and small precipitation or not.\* Westerlies prevails: this is the belt that extends from 30° to 60° latitude from the ITCZ. In the Northern Hemisphere, these are responsible for much of the weather movements across the U.S. and Canada.\* Eastern Pole: This belt covers latitudes of 60° to the North and South Poles.
