The idea of a smart mirror seems like some crazy thing from the future, but over at Adafruit, they show a very easy way to build your own with an old Android device and a two-party mirror. You will need to do a bit of work to get the Android software up and running, but otherwise it's just as simple as packing a few materials behind the mirror and then hanging it on the wall. The end result is a futuristic mirror that gives you an idea of your day's calendar and events. If Android isn't your thing, I'd imagine an old iPad with something like a status board set to work just as well. Head to Adafruit for a full guide. Android Smart Home Mirror (en) Adafruit Roku already has a lot of amazing features, but now it rolls out the screen mirror beta, so you can share the phone screen with the TV. Finding the perfect set-top box can be tough. Changing prices, functions and services all means ... More Roku is currently rolling out the beta version of its own screen mirror function, and you can share almost everything from photos and websites to video games and presentations. Or, in theory, you can watch a video on an app that Roku doesn't support. If you want to join the beta, you'll need either a Roku 3 or an HDMI Roku streaming stick. See if your laptop or mobile device is on the list of compatible devices, and then follow the instructions to turn on the mirror screen on your Roku player to get started. (Compatible devices mainly include Nexus, Samsung Galaxy and Microsoft Surface devices, as well as several others.) Introducing the beta version of Roku Screen Mirroring for @ Windows and Android™ devices (en) Roku blog Google officially announced the first developer of a preview Android 11 for Android TV devices. The new version can only be installed on the developer's hardware, so don't try to use it. Google says Android 11 will bring a lot of privacy, performance, accessibility and connectivity. The first developer preview for Android 11 on smartphones dropped back in February. Now it is at the beginning of the beta period, which means we are on track to see it in stable shape this summer. However, the Android 11 version due on Android TV devices starts its life cycle today. Google revealed on the Android Developers blog that the first developer preview for Android 11 will be available for ATV developers starting this year. Obviously, this means that a stable rollout of Android 11 will come on TVs and streaming boxes much later than it would be for smartphones (although this is not surprising). Related: The best Android TV devices: what are your options? To be clear, this is only for developers and will only work for developer-oriented hardware, particularly ADT-3 streamers supplied by Google. Don't try to install this on Nvidia Shield TV or Sony TV, as it will cause a lot of problems. Google says it has an Android TV TV version Android 11 will be truly equipped with many features of privacy, performance, availability and connectivity. We need to wait until the developers can break it up to know exactly what these claims might mean, however. What we are most interested in is to see whether Google's mysterious streaming stick will be mentioned in the Android 11 code. Stay tuned for this. Tagged: Android TV Android 11 Screen Mirror is not the most popular thing people do with their devices. However, there are many niche cases of use for such technology. Some people like streaming. Others use it for technical support. Whatever the reason, we hope to be able to help you achieve it. Here's the best screen mirror app and screen casting apps for Android along with some other solutions that work! Chrome Remote Desktop Price: Free Chrome Remote Desktop is one of the most popular screen mirror image apps. It doesn't allow you to mirror your phone's screen on your computer. In fact, it's just the opposite. The app lets you look at your computer's desktop on your mobile device. It works best with pills. However, it's great for use on your phone. It should also work on any computer with Google Chrome browser support. The app is also free without in-app purchases. Google Home Price: Free/Chromecasts cost money Google Home is an app for Google Home, Chromecast, and other Google devices. You can directly throw the screen from device to TV using this app and Chromecast. It actually works impressively well. However, most cases of use, like streaming video, are better done on Chromecast rather than mirroring the screen. However, if you need a phone screen on your TV, this is a great way to do it. You have to buy Chromecast for this to work. The app is free, at least, and it didn't make a mistake or any major problems during our testing. Microsoft Remote Desktop Price: Free Microsoft remote desktop is very similar to Chrome remote desktop. In fact, it does basically the same thing. It shows you your desktop computer. The app supports Windows Professional and Server editions. It also works well for streaming video and audio if needed. It's completely free without in-app purchases or advertising. Those who run Windows should probably use this one. Otherwise, Chrome's default is a Remote desktop for other operating systems. TeamViewer Price: Free (for personal use) TeamViewer is one of the most popular applications for mirror Screen. This one is mostly for diagnostic purposes. If necessary, you can look at desktops or other mobile devices. It supports HD video and audio transmission, 256-bit AES encryption and file transfers from both devices. It also supports Mac, Windows and Linux natively. That's great news. The app is free to use for personal use. Those who work businesses have different payment options. Your phone Microsoft Price: Free Your Phone Companion is Microsoft app. It still has some bugs, but it already does more than a lot of Android apps to connect your phone to Windows. Once connected, you can view photos, reply to texts, make phone calls (on a PC with Bluetooth), and yes, throw the screen. In fact, you can throw your screen as usual, or run the Android app, which also launches screen casting mode. Your Companion phone is still a bit of a buggy, even on phones where it comes native like a Samsung device. However, when it works, it's an outstanding solution for screen mirroring. Video Bonus: Native smartphone and smart TV mirroring Price: Free Many smart TVs and smartphones can screen mirror things native. For example, many Android devices can tide the screen on almost anything that has Miracast or Chromecast support. As long as your smart TV or smart key or anything can do it, you can screen the mirror without downloading the extra app. This is the quickest and most effective way to make a mirror image of the screen as long as you have the proper equipment already in your home or area. We have Miracast bound on the button below as this is one of the native options. Hardware devices such as Chromecast or Kindle Fire Sticks Many modern TV streaming keys have mirror image support for the screen. Several options include Amazon Fire TV and Google Chromecast. There are some limitations for each platform. However, they tend to work pretty well. Those who own Chromecast can just pop open the app, open the menu, and the cast screen option should be there. This is especially nice for playing mobile games with a controller. The delay is low enough where it should not affect the experience in most games. For movies and TV, we recommend only promotions Chromecast or Fire Stick functionality without mirror image. Fire TV is a little tricky. You use the mirror image function of your device (on Android 4.2 or above) to connect to Fire TV. This is similar to how it works on compatible smart TVs. Kindle Fire devices can mirror Fire TV much easier. It takes a bit of searching around because the options are very numerous. Some TVs can do it, and some TVs can't. Any Android device on Android 4.2 can initiate a mirror image of the screen using a supported TV or streaming stick. Most smart TVs and streaming sticks will work for this. It takes a bit of tinkering in your menu system, but it works very well once you get it going. HDMI-out The best and easiest way to screen mirrors is to use a cable. Unfortunately, this technology is becoming more and more and harder to find. Most Samsung and LG devices still have it. Outside of these companies, it gets a bit of a hit or miss. Although it is a pioneer for USB Type-C and its native HDMI capabilities, Google Pixel devices do not have an HDMI out. It's annoying. However, it is usually quite easy to find out if the devices have HDMI-out HDMI-out support. After that, you just have to get the right cable. Older Samsung devices typically use MHL, while LG usually uses Slimport. Most other devices, if it supports HDMI, use one of these two protocols. New USB-C devices usually don't have any specific protocol, and most HDMI cables to USB-C should work as long as the phone supports this feature. HDMI-out has the advantage of being rock solid. You can use it offline, there is no concern about strange connection problems if the cable breaks, and the prices for such cables are usually pretty reasonable. Those with Samsung devices can also check out their DeX mode with Windows PC, which allows things like a mirror image of the screen, but in a full desktop experience that happens entirely on the phone. All you need is a USB cable to connect it to your computer. Vysor and other ChromeKoush extensions in Vysor and similar Chrome extensions work very well. They allow you to mirror the device's screen on your computer using Google Chrome. These methods tend to work well enough for most usage cases. Most extensions have instructions for use. Normally, this does not require a cable. At worst, it requires the usual charging of the cable. So you usually don't have to make any additional purchases. You can download Vysor by clicking here (on your computer). The app is available on Google Play. We'd include this in the list above, but the bulk of the process is on your computer, unlike your device. There are other expansion options as well. Play with a few and find one that works with you. Capturing card-cap cards are a kind of last resort. Your device needs HDMI-out capabilities, as explained above, otherwise it won't work. From there you need to buy a capture card. Currently, the best option for smartphones is the Elgato HD60S. You plug this into your computer and then your phone into the capture card. From there you use card capture software to view the screen on your computer or laptop. The big drawback of this is that it is very expensive. Grabbing a card can only go for about \$200 (usually a little less) and then you have to buy an HDMI cable for your phone as well. However, it's a solid rock decision. We have used it for years. You get fewer frame drops, more stable connections, higher bitrates, and you can also record the screen if you need to. If you need it for something simple, like showing off some photos on TV, this is not what we recommend. This is only recommended for the most hardcore screen mirroring application and especially for recording the screen Game streaming. If we missed any mirror app screen and other methods, tell us about it in the comments! You can also click here to check out our latest Android app and game lists!
