Click the DIRECTION button to cycle through different air conditioning operations depending on the model. This button is exclusive to the LN range because it uses an i-see 3D sensor to locate residents in a room. The indirect airflow device determines the location of the occupant in the room and automatically adjusts the fans to divert the flow of air from the person. The direct airflow device determines the location of the occupant of the room and automatically adjusts the fans to divert the flow of air towards the person. Uniform airflow Using microprocessor logic, the device learns over time when the passenger spends most of his time in the room and automatically adjusts the fans to divert the flow of air for an even temperature. 3D i-See Sensor Control Use a small object to press a SENSOR button to activate and loop through various i-see 3D sensor functions. Available only for the LN range. The Active i-see 3D control sensor is controlled on the basis of reasonable temperature and detects the thermal signatures of the residents in the room. Detection of absences (energy saving) If after 10 minutes the device does not detect people, the device will automatically go into energy-saving mode, and then reduce energy consumption even more after 60 minutes. The device will return to normal operation as soon as the person is found in the room. Detection of absence (Auto Off) If after 10 minutes the device does not detect people, the device will automatically go into energy saving mode, then after 60 minutes will automatically turn off. Do I need to change Mitsubishi Electric air conditioning from cooling to heating or cooling? Here are the remote control symbols for different modes of operation. AUTO Mode If MODE characters look different on your remote from the above, please consult with the user's guide for your specific air conditioning model. Most of us tend to just go to the On/Off button in our air conditioning remote and sometimes regulate the temperature when the sun is merciless that day. The meanings of the air conditioning remote characters seem more difficult to understand than a woman's heart. After all, it's almost like all the other buttons in the remote control are redundant - just like all these air conditioning symbols we see on the remote screen. In fact, why is there even an LCD display? Here's the thing: each of these icons plays a role, and when used properly, you can cool your room while keeping up to 20% of your electricity bills. We've also made a video on the subject, so you can check it out: Before Note that this guide applies to most air conditioning brands (whether it's Hitachi ac remote meaning characters or Mitsubishi air conditioning mode). Values of remote air conditioning symbols These AC Remote Symbols to Save Electricity! If you had taken the effort to read the instructions of your air conditioner, you would have known about it, but how many of us do it? Here's an image of the guide. Image: weknowyourdreamz.com, usually for most remotes, there would be four key sections on the LCD display: temperature, timer, mode and fan. Sounds pretty simple, doesn't it? I suppose most, if not all, of you are aware of the temperature and timer sections. Image: weknowyourdreamz.com sections that confuse us with mode and fan settings: what about the complex settings and these weird icons? In order to access the mode and set up the fan, you may need to open the case to reveal a number of buttons that look as alien as the settings in the new car. Then you'll see the mode and the fan buttons. Mode, the most complex air conditioning symbol in the world Image: illitrateman.blogspot.sg Usually you will see first of all the four main modes that you can choose: Auto, Cool, Dry and Fan. I checked a few air conditioners in my office and couldn't find the heat, and for good reasons: why the heck do we need heat? So, what does each of the modes do? 34YO old virgin Sporean is desperately looking for a friend and amazingly, she really found one on the internet. But man's intentions make you cry. Prepare fabric paper to watch this video based on real events: Auto As the name suggests, you allow the air conditioner to decide in which mode to use, depending on the room itself. In most cases, this will work just fine, but you won't have control over what mode it is in. Cool When this mode is installed, the air conditioner will do its best to run it at the temperature you have set. Without going into the inner workings, you just need to know that in order to keep the room at a certain temperature, it needs strong fans and a compressor, which leads to - wait for it - higher bills. But you expected that, didn't you? Dry We have the whole article to this, and here's a brief glimpse of how it works: it removes moist air from the room rather than blowing cool air in. And because it doesn't require much energy to remove hot air, it's usually friendly to your wallet. Fan Fan is what the fan does: it blows out the cold air. Yes, you will hear strong wind gusts coming out of the block, but all you get is the wind. While it saves energy because it's, um, just a fan (especially if the compressor is off or not strong enough), you're better off with just a ceiling fan instead. In the The fan means that temperature is not a priority: moving air. And also, it gives you the illusion that the room is cold. Fan button: What is this Aircon symbol? Now, that's when Becomes even more confusing: why need a fan button when there is a mode for it? The fact is, the fan doesn't have an intelligence ratio of 100 - even when you turn on the fan mode, it won't know whether it has cooled you off. So you have to manually decide how strong you want the fan to be. As mentioned, this is usually for people who want to use only fan mode: if you use any other mode, it will work automatically. So, what kind of mode should we use? Obviously the dry mode will be better, as it uses less electricity and does the job. However, when it's too hot (usually when there's a window in the room), the dry mode may not have enough time to remove all the hot air that comes in. Why do I need to know the remote control symbols of the air conditioner? For a simple reason: if you want to pay less in your bills, knowing that it will help you in the long run. After all, what do we usually do when we feel hot in an air-conditioned room? We're turning off the temperature. Does it really work if you are in dry mode? What do you think now? Ever grabbed a remote control and wondered what the heck all these different air conditioning characters were? If your main air conditioning setup didn't take time to explain what all the characters meant and what the different settings actually do - they might as well be ancient hieroglyphics or alien icons. With that in mind, we'd like to unravel the mysteries of all these air conditioning settings before we start... We should note that there are hundreds of different air conditioning companies out there (we have at least 63 air conditioning brands on our website!) they are from host countries including Japan, Korea, China, USA, Germany and Italy. These companies manufacture all types of air conditioning systems such as ducts, split systems, floor consoles and cassette air conditioners and sell countless different models. In short, there are hundreds and hundreds of air conditioners from which to choose - and you can be sure that some of them have their own idiosyncratic characters. Having said that, there are some pretty standard air conditioning settings characters, so we'll focus on them and close the options. Common air conditioning settings are let's start with the most common of all: First, the universal symbol that means turn the machine on or off, while the plus and minus buttons raise or lower the ambient temperature. Then there's the symbol looks something like: or any symbol of flakes of snow means that Block A/C will run in cold mode (i.e. throw away cool air). Next is one that resembles the sun: either or it obviously means that the air conditioning will work in heat mode in the reverse cycle machines. Cycle. The next air conditioning symbol can be a little confusing: or even if it shows water, it actually means that the air conditioner is in Dry mode, a function that removes the unpleasant humidity from the ambient air, while at the same time emitting cold air. Next we have a fan symbol: either or this means that your air conditioner is in vent mode; it will work like a fan only, and throw away either warm or cool air, just ambiable air. Similarly, if you see a character like this: either or it indicates the internal speed of the fan. The more bars you see, the faster the fan will run. The next symbol is the automatic function: either the automatic function supports the desired temperature as soon as it has been reached. It works both in heating mode and in cooling mode. Next we have a symbol of the installation of air conditioning, which is quite clear: either this means that the air conditioning is in Silent Mode or Silent Operation. In this environment, the device will work as quietly as possible, reducing the noise level of the fan speed to a minimum. The next character has features on most machines: either or it is a vertical air swing. It can be set to direct air vertically, either in a static position, oscillating or automatically. This brings us to this symbol: either or this time it is Horizontal Air Swing, in which we choose the horizontal direction of the airflow. Need more cooling or heating? Try this character: either or it's a turbo button. This will force the machine to operate with maximum non-stop capability for 15-30 minutes (depending on the model and model). Other air conditioning settings characters as well as common characters that we just explained, each air conditioning manufacturer has its own features, each with its own individual characters. Here are just a few of them. For example, LG have a feature that allows you to raise the temperature (or drop) by a few degrees while you sleep. It's called sleep mode or night mode... They also have a regimen than can reduce energy consumption by 25% or 50%. It's called econo function... Mitsubishi Electric has two super-smart sensor features, one that controls the direction of the air, the i-See Sensor... Plus, what turns on or off if it detects the presence or absence of people in the room. It's called a presence sensor... It's similar to Daikin's Smart Eye feature... and Fujitsu's energy-saving feature... Also, many modern air conditioning manufacturers include programming features shown as the following symbols... or they allow you to plan cooling or heating based on your lifestyle. For example, you get home with at 6pm, so you can program/C to start at 5:45 p.m. Need to know what an air conditioning setup symbol is and what it is used for? Just ask Acer Services!
