At this point it pays to make sure that the tool-basket will fit securely back into the box. You will need to make sure that any selected accessories will fit the tray in place. For my site needs, I decided that I would need an inverter (to provide AC power for chargers and small appliances). My needs were under 400 w, so it was an inverter I decided to use. It is attached to the front wall using 4 #8-32 bolts, trimmed to 1 to keep them from closing against the terminals at the back and grounding the cork at the front. Inverter cable 10AWG, although for 400W, 12AWG would be reasonable. I also determined that a USB charger for our cell phones and radio would be a useful accessory. It is a 12V car charger with 4 2.4A ports. I cut the power wire 3 longer than it was needed to connect the ring terminals to the 12V side of the box and fed it between the inverter and the side wall to keep it aside. Because sometimes 400W and 2 plugs aren't enough for all our energy needs in place, I added an internal 12V socket to the left side. It has a built-in 15A fuse, and can be used for another inverter, or lighter, or any other 12V accessory you may need. Ring terminals for all accessories are now sorted by Power and GND (usually red and black respectively), after which they can be attached to the BOLTS of the DC terminal and fastened by another lock washer and nut. Make sure that none of the wires are arched in a way that would prevent the tool basket from being installed properly. After determining that everything fits, the project is technically finished and the batteries can be connected to their power cords, paying close attention to the polarity. I decided to add one of my previous projects, a remake of ... With a lightbar accessory lamp at the end, which tucks nicely under the tool tray without touching any of the battery terminals. If you're worried about this short circuit through any of the tools, you can also add a narrow-wrap or electric tape over the open bolts and terminals. I decided not because they are all under a basket of tools that will not be removed while working, or in the workplace at all. The first thing you may notice about the new RIDGID R8224K 12V palm driver is that there is no trigger. To operate the device you just pick it up and click down on the screw and it starts driving. RIDGID calls this its push-to-drive technology, and it includes a pressure-sensitive variable-speed switch that controls speed by pressing down on the tool. This eliminates the need for a trigger and allows you to hold the tool in any This content is imported from YouTube. You can find the same content in a different format, or you may be able to find more information on your website. The compact size of the tool helps get it in tough space and since you no longer have to keep it in a certain direction, it should work where other tools won't. It is also small enough to fit in a kitchen drawer, making it easily accessible to work around the house. The driver's palm comes with other features, including LED light, which is useful for those dark spaces, a fuel sensor to check battery life, and a one-handed fast collet boot, making changing a bit faster and easier. This tool comes with a LIFETIME RIDGID service agreement and will be available for \$99 in May 2016.
