It's no secret that YouTube smart TVs aren't really smart. All in all, and a dedicated streaming window or bar way. However, there are quite a few options, so how do you decide which one is best for watching the movie needs? Candidates have five big names in this game: Amazon Fire TV (and Fire TV Bar), Google Chromecast, Apple TV, various Roku boxes and Android TV (it's a more complete platform feature than Chromecast, although they're all Google). It's everyone's problem before we go into something that makes them different. Apple TV is for those who really invest in the Apple ecosystem. There are two versions of the Apple TV: Apple TV 4K and Apple TV. The 4K comes in 32GB (\$149) and 64GB (\$199), while the usual Apple TV has only 32GB (\$149). If you use 4K, I recommend the 64GB model because 4K video will take place quickly. Amazon Fire TV and Fire TV Stick is Amazon's streaming box market. Both Fire TV and Fire TV Stick feature Alexa voice control and various apps and games to choose from. The 2017 Fire TV costs \$69 and can play 4K videos; while the smaller, less powerful stick costs \$40 and sticks to HD. Android TV Android TV Android is not the name of teleco windows - instead, it's a platform that other manufacturers can use on their own TV feeds. What's even more confusing is not every box running Android is an Android TV box. There are many ways to get Android TV, including integrating multiple TVs. But if you want my short answer on which set-top box will get, just buy NVIDIA SHIELD for \$180. This is, far and away, the best Android TV box out there. Google Chromecast is the easiest streaming device on the list - it doesn't have a real streaming interface on your TV; instead, you put the app on your phone (like Netflix or HBO Go) and the video threw videos out of it into the TV. You can get a regular Chromecast there for \$35, but if you live that 4K life, you can also use Chromecast Ultra, which will cost you back \$70. Roku is probably the biggest name in Play it, and be the real name that starts it all. Roku devices are full of innovative features and an almost unatt'ed application library. And man, there are a lot of Roku products out there - a lot if you also consider products that are no longer manufactured. So, here's a short list of current products: Roku Express, \$30: The simplest, easiest Roku offer. Roku Express, \$40: This little guy has an input component for an old TV. It's neat. Roku Streaming Stick, \$50: Small, compact and relatively powerful. Roku Streaming Stick, \$70: A more powerful version of the Streaming Stick that supports 4K and HDR. Roku Ultra, \$100: Roku crop cream - it supports 4K, HDR and various ports at the back (not to mention the microSD map). Not bad. It's certainly a very simple look, one or two suggestions that each platform is about. What services are available on each box? Roku's home screen, with some of them, many apps are installed. You could say that the most important feature of any streaming box is: what service can you see on it? Not all boxes are created equal here, especially your needs are more specific. We can't list all possible services here, so make sure to do your own research if there is a specific app or service you want to access the streaming box. But overall, that's how they compare. Virtually every big name should be compatible with all these boxes: Netflix, Hulu, YouTube, HBO Now, Showtime, Twitch and other major channels should be available on every platform (although Amazon Prime Video is not available on Chromecast or Android TV, except SHIELD). If you use a streaming service - like Sling, PlayStation Vue, YouTube TV, DirecTV Now or Hulu TV - however, things will be a little harder to define. If so, I recommend going directly to your TV provider to be compatible with the device. For Android TV users, keep in mind that they have options integration that effectively turns it into a Chromecast as well as a set-top box. So if your ISP supports Chromecast, it can also technically be used on Android TV, even if it doesn't have a special interface. It's a half-decision if you ask me, but it's a solution anyway. Of course, there are exceptions. For example, you won't have access to iTunes anywhere other than the Apple TV. Google Play is a bit of a mixed bag - Movies are available on Android TV, Chromecast, and Roku, but none else. As I mentioned earlier, Amazon Prime Video is available on Fire TV (of course), Apple TV and Roku, but it is also only available on NVIDIA SHIELD, where Android TV is concerned. If you're looking for Cody or Plex support, things will be a bit of a hassle. For example, Android TV supports Cody, but most other apps require quite a bit of hackjob work to do. Plex, on the other hand, is a little more ubiquitous. It is available on Apple TV, Roku, Fire TV and SHIELD. It also supports transmission from your phone, making it available to all the boxes we talk about here. When it comes to the number of supported services, Roku keeps the package by a mile. It offers thousands of online TV channels, channels (read: app), although I admit 80% of them can be garbage. I'd say the rest of the box is pretty even in terms of the apps available, although SHIELD will definitely win the crown for games, we'll talk more about below. Which boxes are the easiest to use? Android TV home screen, with lots of recommendations. When it comes to ease of use, things tend to be a bit tricky because what's easy for one person doesn't seem easy for others - and it can also depend on how you watch TV. What I can say is that most of these boxes are relatively simple and easy to use. For traditional boxes, I would say Roku is the easiest to use: its interface is simple, no frills (in a good way). Apple TV and Android TV are both simple, but will be most familiar to those who are already familiar with iOS and Android, respectively. Amazon fire boxes are probably my favorite - I find them more sophisticated than other boxes. Chromecast Exotic monster, as it does not use the traditional interface. Some people may find this to be the easiest option because all you have to do is put the app on your phone and click the transmission button to start watching. If you know your way around your smartphone, you'll find Chromecast simple. But for those who are used to using traditional remotes and screen interfaces for TVs, Chromecast seems confusing and something like Roku would be the best option. What are the outstanding features of each box? In addition to basic usability, each box has a number of exclusive features that make them more attractive. Which ones are important to you depends on what you are looking to do with your box. Here are the outstanding features of each one: Apple TV: The biggest thing here is Siri. It's integrated into the Apple TV, so you can talk to it like your phone - and it can do good things like repeat the line of muttering with subtitles included, search movies by genre (and subgenre), check the weather and more. On the other hand, the Apple TV has the right controller support and game selection thanks to the compatible iPhone and iPad gaming library. Amazon Fire TV: Just like with the Apple TV, Amazon's Alexa digital assistant will accompany the ride here. It's not exactly powerful in terms of driving, but it's still great. Just like Apple TV, Fire TV and Fire TV Stick have support game controllers and plenty of options to play with. Android TV: Like other parts, Android TV is a mess - just because there are too many boxes. You can keep it simple and inexpensive, but the more you pay, the more opportunities you get. For example, NVIDIA SHIELD not only has incredible gaming support, but also has access to Google Assistant, Samsung SmartThings support, Plex Server integration and an additional 500GB build. So yes, you can turn your SHIELD into a server. SHIELD also supports 4K video and private listening through the headphone jack on the remote or game. Google Chromecast: Just a selling point with Chromecast, so you won't find many bells and whistles. Instead of Clean, minimal and easy to use - not to mention cheap (at least for non-4K versions). Roku: Like Android TV, there are many options here, each with its own feature set. If you're looking for simplicity and accessibility, Roku Express is your huckleberry. But if you're looking for full features well, Roku Ultra is the place. It offers 4K, Ethernet, USB, microSD and private listening, by connecting the headset to the remote control. (Although a lower Roku level can do so through a mobile app). How do form factors compare? The form factor may or may not be a big deal for you, and that's fine. Just a few years ago, most of these boxes were the same size and they were basically boring squares. Since then, everything has changed, even a little. Apple TV: It's a small, black, unwritten box. Very clean and minimal (like most Apple products), this product is sure to merge in the background in most home theater settings. Amazon Fire TV: This is the only complete box on the list that resembles Google's online box, not the actual tv box. It actually connects to the TV and then just hangs in there like Chromecast. The thing is, he packs a giant punch under that tiny hat. Kind of like a kid. Fire TV Stick is literally a stick - it connects and is just out of reach. It's weaker, but cheaper than Fire TV. Honestly, available as Fire TV is offered in full today, I don't even know why the stick exists. Android TV: Again, Android TV is not a box, but a platform. There are many options out there. If you want to be small and outdoors, go with the Xiaomi Mi Box. It's very clean. However, SHIELD is much more than that. It is larger and aesthetically charged by a somewhat jagged gamer. I'm not interested in the look of SHIELD, but I can definitely understand why some people might. Google Chromecast: This is a small circle attached to a short HDMI cable. It's just hanging in the back of the TV. Not much to dislike about A what. Roku: Roku products can be divided into two categories: sticks and boxes. Express, Express, Streaming Stick and streaming stick are all sticks. They're leaving the road because they're right behind the TV. The ultra is the actual box, but it is small, thin and clean. It looks beautiful and not ostentatious - it will fit all kinds of jewelry. After all, most of these boxes are quite small, so the form factor doesn't really matter. Even larger boxes are small enough to hide behind a TV. Which boxes support video games? Games are not what you often think of your console, but it is becoming more and more popular, and some manufacturers are using it to customize their devices differently than others. At the moment, most boxes support some kind of game - usually very normal - but others have made it a brand. Apple TV: While not claiming to be famous, there is a pretty good category of games on the Apple TV, most of them are just iPad games that you can also play on your TV. And it supports game controllers for iOS, for a really comfortable Amazon Fire TV experience: Gaming is one of the things that Amazon is almost groundbreaking, since it was the first company to bring realistic games and game controller into another normal body box. This category is not great (as it depends on Amazon's smaller Appstore), but there are definitely some games to choose from and play for sure. Also, keep in mind that gaming situations may be limited to the device you choose - the stick is much stronger than the field, so the performance of the games will be affected. Android TV: Like almost all Android, it's a fascinating topic. Most Android TV boxes support some rudimentary games, but NVIDIA's SHIELD is actually designed for gaming. There are many exclusive games, including some excellent ports of great yes titles. And, it can broadcast games from your NVIDIA-equipped gaming PC. If the game on your box is important to you, SHIELD is the best option. Google Chromecast: Chromecast doesn't really have delivery say, so the game context is greatly limited. There are some family games that you can play on Chromecast, but it really doesn't have what I call the ability to play real games. Roku: Roku hits between Chromecast and Apple TV or Fire TV - there are quite a few very simple, family-oriented games here. There are no game controllers, but the remote control is designed to double like a gamepad. So yes, if you're not really interested in games and just think they're a very limited part of your console experience, Roku is a good choice. Games may be second in the categories above, but it's great to know you at least have options in this space. What are my other options? All that said - and I feel like I've said so much here - there's another segment that can easily fit into the top niche of the game installer box: the console. If you have a PlayStation or An Xbox, you already have consoles. Modern slot machines support 4K video, have access to Netflix and a host of other apps, and can actually make as much as most dedicated boxes out there. If you already have a game console, you probably don't need a special box - unless you really want features such as Siri, Google Assistant, or other things mentioned above. The consoles are certainly more useful for non-gamers. Also, you can build your own home PC cinema with something like Cody or Plex installed. It's usually more useful for local videos than streaming video like Netflix and is a really bold option for those who want something very specific. Buying a set-top box will be a lot easier (and cheaper), but if you're worried to make your hands dirty and enjoy that big pain in creating something like a computer at home, then by all means. Be friends. So which one is the best? Here's the thing: there really isn't a better box out there - only one works best for you. If you're too deep into the Apple ecosystem, you can bring Joni Ive's problem is the original, then God will take the Apple TV. You will love it. If you're all about Amazon's life, Fire TV is for you - maybe a Fire TV Stick if you want to save yourself like thirty dollars, but whatever. Android nerd, just grab SHIELD and do with it. It's a big box and by far the most versatile, powerful option on the list and by far the best Android box. And it's not just the smoke. Chromecast for ordinary streamers who don't want or don't need a lot of fluff. If you're thinking about getting something simple and inexpensive for a bedroom TV, then that's fine. Roku is almost a pioneer in this market, so he has a lot of experience under his belt. Roku Ultra easily offers some of the best values in the console, especially if you don't have loyalty to another company yet. In addition, the Express is the only option that supports RCA entry, so it works with old TVs. It's a good look for Roku.
