DAP DryX Wall Repair Patch Kit comes with everything you need to repair holes in drywall up to 3 in diameter, including: Spackling Self-glue wall patch Sandpaper Putty knife The DAP DryDex Wall Repair Patch Kit is available at Home Depot. Further Information VIDEO TRANSCRIPT Jodi Marks: You know so many times we talk about improving your home, but sometimes you have to do a little bit. And I like it when manufacturers collect a kit for me, so all I have to do is come and rip it off the shelf, go home, and do my repairs. Especially my wall repair. Now DAP came out with a great product. It's opened, I opened it to show you that everything comes in the kit. Now it's not something new. DAP came out with DryDex a few years ago. And when you apply it, it goes on pink, but then when it dries up and it's ready for the sand, you know he's ready because it turns white. Another thing though, what happens in this kit that I like is a bit of a putty knife. You'll also get a bit of a grinding pad. But this is where the magic begins. It has a little peel and stick to the aluminum glue here that you stick right over the hole. So all you have to do is put this over the hole. And you can get up to a three-0 hole repair on this kit. And then what you do is that you take the spackle and you spread it, smooth it out, feathers it around the edges. Let it dry, sand it. You should probably go ahead and make a second coat. Let it dry, sand it. And then you'll be ready for the prime and paint in at the wrong time. Giovanni Guarino/N/A/Getty Images Mixing ratio plaster is to use at least 3 cubic feet of plaster on a cement bag for a scratch coat and a maximum of 5 cubic feet per bag of cement for a brown coat. Water is added to the mixture as needed. The scratch coat is added first and is the thickest of the coat, usually about 1/2 inch. The brown layer is then added, building a thickness of up to 3/4 inch. The last layer of plaster applies to the trim coat, made plaster, which is pre-mixed and requires only water. Three layers require a minimum thickness of 7/8 inches above the frame design. Skip navigation! Stucco can withstand for 100 years or more, but that doesn't mean it's impenetrable. Cracks and holes that develop on the surface let into the water, which can quickly cause further damage to plaster and main surfaces. Patches of plaster can also break out of the wood or metal straps it adheres to, resulting in loose areas that can grow over time. Thus, small holes often turn into larger ones, along with greater exposure to moisture and Areas of plaster that have come loose or completely fallen away should be repaired with a complete process of restoring the removal of free material, installing new building paper and metal foam, and applying three layers of plaster repair mixture. Alternatively, if the original original 3/4-inch thick or smaller, you can apply one layer of plaster patch (up to 3/4-inch thick) and spat it up to the desired finish. While you can mix your own plaster using traditional recipes, using a good quality pre-mixed plaster repair mix ensures that you get the right mix for the app. These products are blended for exceptional strength and communication and can be applied and painted just like standard plaster. The fast-fixable formula also dries much faster than traditional plaster, making the repair process much faster. Remove all loose or otherwise damaged plaster in the repair area by pressing it with a hammer and a cold chisel. Take away the loose pieces until you reach firmly adhered plaster around the perimeter of the area. Be careful not to damage the underlying tree straps or shells. If there is a metal lab under the stucco, cut it around the perimeter using metal scissors. Remove all nails or screws that provide the strap and remove the strap from the wall. Cut two pieces of Class D building paper to fit the patch area. Each part should cover all open wood materials to create an effective moisture barrier. Prepare the first sheet of paper for a wooden foam or plywood shell, if applicable. Make a second piece of paper over the first. Cut a piece of galvanized metal mesh plaster using metal scissors. As in the case of building paper, the bar should be compared with the repair area, so that there were no gaps between the bar and the edges of the original (well adhered to) plaster. Spread the lat over the construction paper and secure it with galvanized roof nails. Nails should be long enough to penetrate 1 inch into the wooden framing of the members behind the original straps or, if the wall has a plywood shell, the nails should penetrate to the full depth of the shell. Mix a batch of fast-installing repair plaster, following the manufacturer's instructions, using a drill and mixing a paddle or, in large quantities, a mortar mixer. Keep the mixed plaster in the shaded area, and be prepared to apply it as soon as it mixes. A quick plaster installation usually has a working time of 45 minutes or less, so mix only as much as you can apply at a time. Spray the edges of the plaster around the patch area with water (to prevent premature drying of new plaster). Scoop a fist-sized amount of wet plaster on a spatula and then sling the plaster onto a metal strap to insert a damp mixture into the holes in the mesh. The plaster should be able to hold onto the mesh on its own. Repeat the process to cover the entire area of the patch and then smooth the plaster into a flat, even layer that within 1/2 inch of the original plaster surface. Press thoroughly and smooth the damp plaster around the edges of the patch to glue the new plaster with the old one. Scarify the scratches of the coat with a spatula or scarifier, then let the coat be cured as directed by the manufacturer of the mixture. You may have to plaster, spraying it with water periodically. Treatment can take as little as one to two hours, depending on the conditions and plaster of the product. Mix a batch of plaster for a second, or brown, coat. Trowel plaster on the surface of the patch in a smooth, smooth layer that is sunk 1/8 inch from the surrounding original plaster. Let the brown coat be cured as indicated by mist with water as needed. Mix the batch of plaster for the final, or color, coat. This coat can be a standard or custom color order to achieve the desired look. However, it is a very difficult color-match patch so that it is mixed with the surrounding plaster; Hiding a patch completely often requires painting or covering the entire wall with compatible paint or pigment coating. Apply the final layer with a spatula to make it flush with the environment. The texture of the coat, if desired, to match the original finish. Let the plaster heal as directed. sansarc.studio/Instagram This stunning home from sansarc.studio is painted in pure, crisp white that feels completely Mediterranean and coastal. Arched metal windows and doorways add a modern, industrial look to the house while a clay brick fence keeps it earthy and fresh. While painting plaster white can mean a little extra effort in the power wash department, it's a cool, modern choice for any home. Stucco is a mortar mixture that is commonly used as an external siding application on homes. Historically, it has been used as an environment sculpture for architectural ornamentation. Stucco can be done by mixing sand and lime with water and various other ingredients, most often cement. Like the icing on a cracked layer of cake, a good layer of plaster can enrich the once shabby appearance. The plaster material, however, has many decorative uses and is found all over the world. For centuries, plaster has been used not only in Middle Eastern mosques, but also as an ornate rococo ornament in Bavarian pilgrimage churches. Stucco is more than a thin veneer, but it is not a building material - the wall of plaster is not structurally made of plaster. Stucco is a trim applied to the wall. Typically, wooden walls are covered with tar paper and chicken wire or galvanized metal screening called a shell ball. The interior walls may have wooden lats. This structure is then covered with layers of plaster mixture. The first layer is called a scratch coat, and then a brown layer is applied to the dried scratching coat. The toned finish of the coat surface everyone sees. For masonry walls, including a damaged brick and concrete block that the homeowner wants to hide, the preparation is easier. The binder is usually brushed, and The plaster mixture is applied directly to the power washed and prepared masonry surface. How to repair plaster? Historical conservationists have written a lot on this subject in Brief 22. Stucco is often defined as as as is done and where (and how) it is applied. Historical conservationists in the UK describe the common plaster as a combination of lime, sand and hair - with hair long, strong and free of dirt and fat, from a horse or a bull. A 1976 Time-Life home renovation book describes plaster as a mortar containing hydrated lime and asbestos - probably not a recommended supplement today. The 1980 Penguin Architecture Dictionary simply describes plaster as plasterwork usually turns out to be very smooth or modeled like in stucco ceilings. The Dictionary of Architecture and Construction covers all grounds: plaster 1. The exterior finish is usually textured; consists of Portland cement, lime and sand that are mixed with water. 2. Thin plaster used for decorative works or moldings. 3. Simulated plaster containing other materials such as epoxy resin as a binder. 4. Partial or fully calcified plaster that has not yet been processed into the finished product. Although stucco-sided homes became popular in twentieth century America, the concept of using stucco blends in architecture dates back to ancient times. On fine-grain hard plaster surfaces, made of plaster, marble dust and glue, wall frescoes of

ancient Greeks and Romans were painted. This marble dust compound can be cast in decorative shapes, polished glitter, or painted. Artists such as Giacomo Serpotta became stucco masters, incorporating figures into architecture like a male nude, sitting on the eaves of a window in the oratorical cathedral of the Rosary in Saint-Lorenzo in Sicily, Italy. Stucco techniques were developed by Italians during the Renaissance and artistry spread throughout Europe. German masters, such as Dominiques Tsimmermann, brought the stucco to a new artistic level with complex church interiors, such as the Whisky in Bavaria. The appearance of this pilgrimage church is really a hoax by Zimmerman. The simplicity of the walls on the outside belies the extravagant interior ornamentation. Many houses built after the 1950s use a variety of synthetic materials resembling plaster. Mock plaster siding often consists of foam insulation boards or cement panels fixed on the walls. Although synthetic plaster may look authentic, real plaster is usually heavier. The walls of the genuine plaster sound solid when tapped and will be less likely to suffer from a strong impact. In addition, the authentic plaster holds up well in wet conditions. Although it is porous and will absorb moisture, the original plaster will dry out easily, without compromising the structure, especially when it is installed with a crying screed. One type of synthetic plaster, known as EIFS (External Insulation and Finish Systems), has long been associated with moisture problems. At the heart of the wood homes tend to suffer rotting damage. A simple web search stucco lawsuit shows a plethora of problems up and down the east coast dating back to the 1990s. years. Say plaster can be done correctly, or it can be done quickly, reported Florida 10NEWS-TV. And when builders try to put homes as quickly - or as cheaply - as possible, they often choose the latter. Other types of synthetic plaster are durable, and AIA magazine, The Architect, reports that building codes and commercial products have changed in the last few years. It is always wise to have a professional inspection before buying a plaster side of the house. Stucco siding can most commonly found on Mission Revival style and Spanish and Mediterranean-style homes. When traveling to the southern U.S. neighborhood, note that the concrete block is often used for sturdy, wind-resistant, energy efficient homes and public buildings such as schools and town halls. Many times these blocks are finished only with heart paint, but the coating plaster is said to increase the value (and status) of these concrete block houses. There's even an acronym for practice-CBS for concrete block and plaster. When visiting Art Deco buildings throughout Miami Beach, Florida, note that most have plaster above the block. We were told that developers who insist on stucco finishes on wooden framed designs end up with a bunch of moisture problems. But not all plaster problems are the same. A wall of straw bales will have different needs than a concrete block or a wooden frame. Advising a Stucco restoration specialist who may know nothing about the construction of straw bales can be a mistake. Stucco recipes are not the same size fits all. There are a lot of mixtures. Having said all this, you can buy pre-mixed and pre-formulated plaster. Both DAP and Kikete sell bags and buckets of the mix in large box stores and even on Amazon.com. Other companies, such as Liquefix, supply stucco blends to artists. Revisiting the EIFS, a once malignant cladding system that could help architects meet with the new energy codes of Elizabeth Evitts Dickinson, Architect, August 5, 2013Florida's billion-dollar plaster problem by Noah Pansky, WTSP, 10NEWS-TV, June 24, 2015Kuk Book Stucco: Basics of Herb Nordmeyer, 2012Exterior Stucco Jan Constantinides and Lynn Humphreys, Building Preservation Catalog, 2003 in buildingconservation.com access February 12, 2016Time-Life Books, Home Renovation and Improvement, 1976, Masonry, Index / Glossary, p. 127 Penguin Architecture Dictionary, John Fleming, Hugh Honor, Midolaus Pevner, 3rd Edition, 1980, page 313Dictional Architecture and Construction, Cyril M.
