Free, simple and comprehensive, there's little reason not to have superior Avast protection on your phone. Aside from malware and Trojan protection, its security features and remote commands are a great way to ensure that your phone is always accounted for. It also consumes much less processor power than many other similar antivirus programs, making it a no-brainer to have running in the background. More Avast Antivirus images are a complete security set that provides Android devices with full functional antivirus and protection from theft. Avast Antivirus protects your personal data by automatically scanning viruses that detect and defeat threats on your phone, and Web Shield alerts when you visit URLs that may contain malicious data. The app also provides anti-theft features that can be accessed via remote SMS commands for the history of swipes, phone locking, siren activation, GPS tracking, audio monitoring and many other useful tools. The app also provides you with the Lock App, where you can restrict access to other apps for a secure PIN. In addition, you will also get readouts on the various permissions of apps installed on your phone. Avast Antivirus also comes with important components such as on-demand scanning, using its powerful antivirus engine, privacy reports, SMS/Call filtering, application manager, spyware and ad program blocking, completing your toolkit. Also, check out the forums. Download Source: Nicole Johnston/Android Central Best Antivirus Apps for Android Central 2020 We tested several antivirus apps on Android mobile phones and tablets to find out which offer excellent malware protection without causing too much resistance on your device. Bitdefender Mobile Security is the overall best. In fact, this is my best choice for Windows and Mac antivirus, too. Bitdefender ranks high for malware protection, does not use too many resources, and includes a few additional tools. It's also overall good value for money. Source: Nicole Johnston/Android Central Bitdefender seems to be doing almost everything you need. It stops malicious attacks and has web protection that alerts dangerous websites before visiting them. This app uses power management to use the phone's little battery to avoid With this app, you can also remotely access your phone to destroy data, block it, or send a message to your device. You can also find it with this feature, and connects it to an Android smartwatch to help remind you to grab your phone or find it when left behind. This is a good way to track your phone if it is ever lost or stolen, as well as providing personal information. Bitdefender Mobile Security also has a VPN and allows you to send and receive 200MB of encrypted traffic every day. It's not much, but you can More. Bitdefender Mobile Security is, for the most part, easy to understand how to use. The dashboard is overwhelming with tasks and information when you first open the app, but I was able to erase those features that I didn't need. However, the VPN tool is constantly attached to the dashboard. Stopping Malware Attacks Minimum Use Resources Phone Locator Connects with Android smartwatches has a big value Extra VPN encryption cost more Dashboard can be difficult to make out on the first Best Mobile Phone Protection Bitdefender stops threats from infecting your mobile devices, includes VPN and does not cause slowdown. Source: Nicole Johnston/Android Central Main version of the app is a free mobile security program that blocks both malware and spam messages. However, Avast Ultimate program includes a VPN to hide your online activity. It includes a password manager to track login credentials, as well as a data shield to protect photos, contact information and other sensitive files from a swipe. Avast Mobile Security removes ads, blocks apps with a PIN to protect sensitive information, and clears debris from the phone so it works faster and keeps weak spots closed so hackers can't get inside. Wi-Fi security provides an extra layer of protection for your phone and sensitive data when you're connected to public hotspots. The dashboard is clean and easy to find the tools you need. However, Avast doesn't make it easy to include all its features. For some tools, you are offered links and requests for permission. For others, you need to find more information and include features in the Privacy section. You may also need to perform several and different types of malware scans before Avast finally finds all the damaged and malicious files on your phone. Includes VPN Password Data Manager Shield Base version of the free Helps your phone run faster Clunky interface scanning can take several attempts Dear Guard confidential information Avast not only stops malware, but protects sensitive information from ransomware and hackers. Source: Nicole Johnston / Android Central This app blocks phishing schemes in both email and text messages. Kaspersky also blocks your and your contacts' information, so if someone steals your phone, no one will have access to it. This antivirus solution blocks apps, filters calls and texts, and blocks malware, including ransomware. Kaspersky Mobile Antivirus also includes several anti-theft tools, including phone locator and locking so that no one has access to sensitive information. The App Lock feature blocks photos, messages, and other apps with secret code that must be entered before you or anyone else can access them. While Kaspersky is easily one of my favorite antivirus programs, even for desktop computers, it has been accused of swiping confidential information from federal employees and the department's department and providing this information to the Russian government. While Kaspersky has vehemently denied the allegations, the U.S. government has ordered Kaspersky not to use on its devices and to recommend its employees do the same, even independently, personal devices. Phishers Remote Lock Phone Ransomware Protection App Lock protects your files Big price is not recommended for public employees Text and Kaspersky email protection monitors email and text messages, including attachments, for dangerous links or files. Source: Nicole Johnston/Android Central One of the key features of McAfee Mobile Security is the Theft Cam tool, which snaps pics of those trying to access your phone without permission. The app then sends the photo, along with the location of your phone, to you to help track down the thief. If someone tries to access your phone, McAfee will block it after three attempts to enter the password. A potential thief cannot remove the McAfee app if they gain access, making the device less valuable if the thief wants to try and resell it. Otherwise, this app helps in other ways. It tracks wi-fi connections for any possible hackers and blocks your apps from non-auto users. This is especially useful when you connect to a public hotspot. McAfee has a Proxy VPN feature that encrypts your online activity using bank grade encryption, so you can't be tracked. I noticed a slight slowdown in my phone while testing McAfee. However, the big problem I had was the number of pop-up notifications I was given. Every time McAfee started scanning, finished scanning, opened or moved the file, the app would give me a pop-up notification, even when I was physically in the app, watching the scan. This can be fixed by changing the app settings, but I'd rather have a simpler type of plug-in and playback program. Stealing Cam Features Wi-Fi Connection Phone Locator Low-cost VPN proxy feature Too many system notifications Some slowdown system helps find the missing McAfee device snaps of everyone who steals your phone, allows you to remotely access and block it, and finds it. Source: Nicole Johnston/Android Central Malwarebytes doesn't stop viral infections, but it does a really good job of rounding up malware that's already on your phone. It recognizes adware or malicious files that are used to track the use of apps and online movements, and then creates targeted ads based on that activity. Malwarebytes then remove them, so you have more free on your phone and a little more privacy. The malware scanner of this program recognizes ransomware and phishing schemes and will warn you if any are found on your device. If you switch to malwarebytes Premium, you will get real-time protection that stops these and other threats before they make it to your phone in the first place. This antivirus app is completely free, and ad-free. Advertising, means you'll never be bothered by pop-up requests to update your subscription to a paid version of Malwarebytes. It works with almost every Android phone and tablet, but it is unfortunately not compatible with Chromebooks. Removes advertising rounds current Infections Completely add free No real-time protection Not compatible with Chromebooks Adware removal with deep virus scans Malwarebytes removes advertising, alerts you about ransomware, and blocks phishing schemes. Source: Nicole Johnston/Android Central Norton app does cause a bit of lag on my phones during testing, but it does a great job of stopping malware from downloading to devices. It also has tools that control the Wi-Fi connection to make sure that hackers don't pass. This app also has a system advisor that gives you tips on how to further protect your devices, like setting up a fingerprint lock. As part of this program, you can connect to Norton's VPN. This feature protects your location and IP device while online. This makes it difficult for the ad to track your online traffic and create targeted ads. Since Norton now owns LifeLock, you have the option to add this tool to your antivirus subscription, but it's worth it. This app really causes a slight lag on my phones during testing. It was so obvious that the phones became slower and it was frustrating to wait for the program to stop so my cell phone could catch up. Shields IP Device and Location Stop Targeted Ads Helps ensure the entire phone system is an advisor giving you tips Access to Norton VPN Reasons for a noticeable slowdown In LifeLock costs additional scans of your phone for Norton's vulnerabilities looking for any way your phone is vulnerable and will help you protect it from malware, spies and hackers. Source: Nicole Johnston/Android Central This app scans for malicious downloads and programs running in the background that can slow down your phone, use too much battery power, or cause the device to overheat. PSafe also includes fake news and spam blockers, as well as malicious link alerts in messaging programs, including WhatsApp. DFNDR tracks your digital identity to keep it safe and alerts you if this information ever is leaked. It also blocks your phone against hackers who try to gain access through public wi-fi connections. If your phone is stolen, DFNDR sounds an alarm, clicks and sends a photo of the thief to you, gives you the location of your phone, and allows you to remotely access to further secure or destroy sensitive information from it. PSafe antivirus mobile app is the most messy and most confusing to find out on this list. There is so much on the dashboard that you need to scroll down a few times before seeing them all. While there is some cool information here, DFNDR adds stats and other common pieces that shouldn't be front and center every time you open the app. Blocks Fake News Stops Malicious Files Digital Identity Theft Protection May find rogue background apps Messy dashboard Expensive blocks of fake news and fake DFNDR links keeps hackers from accessing your phone by monitoring internet connections and blocking fake news, links and websites. Source: Nicole Johnston/Android Central Sophos has a neat scanner that checks links to malware before connecting you to scanned data. It filters text messages and quarantines those with malicious URLs. This app allows you to remotely access stolen phones to destroy data or reset passwords, send text commands to thieves, and track where your phone is. It's not the most intuitive app to use. It took me a few minutes to figure out how to find a list of tools and features, include the ones I wanted to use, and disable those I wanted to miss. Also, some of the directions on how to use some of the tools are not clear. Although the Sophos Intercept X is compatible with multiple devices, I do not recommend Sophos for computer users because it is a difficult program to figure out takes up a lot of resources and is not very effective with overall protection. It's also not compatible with Chromebook at all. However, it's a great program to keep mobile devices safe, including Androids, and it's not as resource-intensive as other programs on your phone. Remote Access Scanner to Lost or Stolen Devices Protects Against Harmful Applications Not Resource-Intensive Free Use Is Not Recommended for Using a Home Computer Not Intuitive to Use When you need a secure scanner using your QR scanner, Sophos gives you extra protection against malicious links, websites and files. Source: Nicole Johnston/ Android Central Malware attacks, including ransomware and phishing schemes, stop the mobile antivirus app Trend Micro. It is designed to protect all your personal data, so thieves or apps can't swipe it. This app optimizes your phone by helping you identify apps that use too much of your data. Trend Micro uses web recognition technology to make sure that when you visit a web page, it is a legitimate, not a phishing scheme or a redirection to a malicious page disguised as a real one. This app also includes parental control, so you can control what your child is looking at on their smartphones, turn off apps, filter web content, or even restrict Internet access while they should be in bed or doing their homework. I noticed that using Trend Micro caused my battery life to faster than other mobile antivirus apps. Other users reported the same problem with their phones. This doesn't seem like a universal problem, but enough feedback about the problem justifies mentioning. Родительский контроль Отличная технология защиты от вредоносных программ веб-репутация может помочь оптимизировать ваш телефон Guzzles ресурсов Дорогие приложения Lockdown, блокировать веб-сайты Родительский контроль позволяет выбрать приложения, которые ваш ребенок может использовать, веб-сайты, которые они visit, and if they can access the internet at all. Be careful when choosing a mobile security app for your Android because multiple apps, especially free ones, don't actually stop viral infections, but collect malware after they've done it on your device. Trojans and ransomware are made for mobile devices at an alarming rate, so malware that blocks virus scanning on top is important. Phishing filters are also needed, as the most common malware is schemes that trick you into providing personal information, including credit card numbers, credential passwords, and Social Security numbers. Also, keep in mind that several antivirus apps offer a free version as an initial download with purchase in the app for the ad-free version. My best choice for Android antivirus is Bitdefender Mobile Security because of the quality of protection it gives you on top of being a good value. During my tests, Bitdefender did an excellent job of stopping both malicious files by trying to download to our phones and phishing schemes. It didn't use most of the resources of my devices, so I didn't notice any lag, even while scanning viruses. I still opened and used apps, sent text messages, and chatted on my phones without interruption or delay. Credits - The team that worked on this guide Nicole Johnston writes for several future publishing brands, including Android Central, covering primarily internet security and privacy programs. It has more than 13 years of research and writing experience in both the public and private sectors, including seven years of testing and review of consumer products and five evaluations of antivirus software, parental control, VPN and identity theft services.
