According to Laure! Storm Like most other modern browsers, Google Chrome offers a private browsing mode called incognito, which is designed to grab information about the websites you visit from stored on your computer. If you're concerned about your privacy and security, especially when using a public or shared computer, viewing in an incognito window offers a number of benefits. Browsing the Internet in incognito can help protect your privacy, especially when you're using a shared computer. The websites you visit incognito are not stored in your browser history, whether you find them through a search engine or enter their URL directly at the address desk. No matter how often you visit a particular website in incognito mode, it will never appear on Chrome's list of most visited websites on the new tab page, and will not automatically complete its URL when you start typing it into the address strip. Similarly, the history of downloaded files and search queries will not be stored, although any files you downloaded will remain on the hard drive where you saved them. Any cookies created during an incognito viewing session are automatically deleted when the window is closed. This makes incognito mode ideal if you are concerned about the security of your personal or business accounts, and is especially valuable when using shared or public computers. Even if you forgot to leave the service after you finished using it, the cookie will be deleted when the window is closed incognito, preventing anyone from inadvertently or maliciously accessing your account. Because cookies are not divided between regular windows and incognito in Chrome, you can use the incognito window to log into a second account on any website without logging in first. For example, you can open an incognito window and log into a Gmail work account, while logging into your personal account in a regular window. Similarly, if a friend comes to visit and wants to quickly check their Facebook account, you can open the window incognito for him to use, so you don't have to log out of your own account. While incognito internet browsing improves your privacy and security, it doesn't completely prevent you from being tracked, since all it does is prevent information about the websites you visited from being saved. If you log into a Google account in an incognito window and then search, for example, that search will be stored in your account unless you've suspended your Google Web history. Similarly, websites that track information about you while browsing will sometimes still be able to do so, depending on the method they use. your ISP tracks which pages you visit, it will be able to do so whether you are using the mode incognito or not, like viruses, keyloggers and other malware. Privacy is fast fast it's hard to earn luxury. When browsing websites, it's hard to get rid of the creepy feeling that wherever you go, invisible eyes are looking at you: Google, Facebook, your internet provider, the government, the person sitting next to you, etc. Among the many privacy enhancement tools, one of the most famous is the Chrome Incotogni window, Google's version of private browsing. The Incognito window provides a measure of privacy if you're browsing on a shared computer. But this is not an ideal solution. Unfortunately, many people don't understand the privacy implications of Google's incognito windows and end up trusting it more than they should. According to a study by researchers from the University of Chicago and Leibniz University in Hanover, many users mistakenly think that Google's Incognito mode and other private viewing windows will protect them from malware, advertising, link lock tracking and monitoring codes. Here's what you need to know about the privacy features and boundaries of the Incognito Chrome window. The privacy benefits of Google Chrome's Incognito google Chrome box in the Incognito box will protect your activity from other people using your device Interestingly, Google clearly outlines everything you can expect from Incognito mode when you open a new private window. According to Google, you can now browse privately, and other people won't see your activity. What does activity mean? Browsing history: Google Chrome tracks the web pages you visit to make it easier for you to return to these pages in the future. Clicking CTRL-H on Windows (§ on macOS) shows all the web pages you've visited before. Also, if you sync your Chrome browser with your Google account, every page you visit will be registered in your browsing history. This means that if you go to another computer and sync your Google account in the new Chrome browser, the browsing history will be rescheduled. The Incognito window will not record the browsing history and will remove traces of the web pages you visit after closing. The privacy advantage you get is that the next person who sits at the computer won't be able to look at your browsing history. Cookies and site data: Cookies are bits of data attached to websites that are exchanged between the browser and the web server. Cookies track user sessions, website preferences, local settings, and other vital features of web applications. Cookies are what allows websites to show different content to each user. When you log in to an online account, we punish Gmail or Facebook, the web server produces a cookie and sends it to the browser. The browser stores cookies and re-sends them to the server each (every time you click on a new button or link). The server uses a cookie for an app associated with it with a user ID and serve content that matches your user account. Cookies also allow web service providers to track you through websites. When viewing a website with a Facebook Like and Share button or invisible Facebook Pixel, Facebook Facebook uses your session cookies to track you, and then uses that information to target you with ads. When you drive a new Incognito window, none of your cookies will be moved. You can check it out by views on Facebook or Gmail. Even if you logged into your account before the Incognito window opened, you'll still be redirected to the login page. Without a cookie, the website will treat you like a new user. The advantage of incognito's privacy window is that you will be able to browse on different pages without traceable cookies (there is a caveat to this that I'll mention later). In addition, if you log into any online account, closing the Incognito window will destroy the cookies associated with the session. Thus, the next person who sits at the computer will not be able to access the accounts that you used when incognito, even if you forgot to leave before closing the window. Information entered into forms: Forms are text areas that you see on pages that require you to complete information such as your name, username, email address, phone number, etc. when information enters the form. It then makes it available on other pages to make it easier for you to enter data into forms. This feature can become a privacy issue, however, if you use a public computer. Other users using the same Chrome browser will see your personal data as they go to pages that have data forms. The Incognito window removes all the information you typed in forms when you close it, giving you better privacy on shared computers. Google's Google Chrome Incognito privacy terms also make it clear that there are several areas where the Incognito Chrome window will not provide privacy. Websites you visit: The easiest way for web apps to track users is to use cookies. But that's not the only way they can track you. Other pieces of information may point to your device. For example, I've seen some users use the Incognito window to view Twitter, thinking it will save their privacy and hide their identity. The premise is that because Incognito does not carry its browser cookies, Twitter will not be able to link their activities to their account. But Twitter also tracks ip address, device type, device ID and type And the version. Technically, he will be able to use all these factors to link your activities to your account. Facebook goes further and even tracks your activity on other websites when you're not in your account. Your employer or school: If you use

a corporate or school network, all will be sent through a gateway such as a router or server. The person who manages the gateway will have full visibility in your traffic, regardless of whether you are viewing Incognito mode or not. They can filter internet traffic networks based on IP addresses and track your browsing habits. Your ISP: Is the provider is the company that gives you access to the Internet. Think of it as a corporate network manager, but on a much larger scale. ISPs are also gateways, which means they will be able to trace all your browsing habits, regardless of whether you use private browsing or not. Bookmarks and downloads: If you download anything when you use the Incognito window, it will remain in the download folder after the window is closed. Also, if you happen to bookmark something while browsing in Incognito, the bookmark will be saved for your main browser. Keep that in mind. The final words about privacy in Google Chrome incognito mode If you want to improve your privacy when browsing with the Incognito window, consider using a virtual private network (VPN). VPN apps encrypt your internet traffic and send it through a VPN server. This will hide your browsing activities from your local gateway or provider. They won't know which websites you're browsing, but they'll find that you're using a VPN. Overall, beware: The Incognito Chrome window is a good privacy tool when you have concerns about other users who have access to your computer and browser. But it's about as far as you can trust it.
