The Revolution Textbook website is home to a search database of free online tutorials. This website has several reasons for being: To serve as a resource directory for students and teachers looking for free textbooks (one-stop purchases) to act as a mirror for files. Mirrors help reduce bandwidth costs and prevent files from disappearing if a website goes out of business. Promote the need and accessibility of free textbooks. Recent additions to the site include topics ranging from Python to the Austrian economy. The site has an extensive database providing a lot of free, high-quality content, and frankly, it doesn't get much better than that. Again, if *it* is more your thing, Check out previously mentioned LearnOutLoud.Download free audio and video lecture from LearnOutLoud.comRead moreTextbook Revolution (No reviews yet) Write Review Number Price applies (No reviews yet) Write review Item: #ROT144 Weight: 1 1.00 LBS Author: Roger Martin Author: Jennifer Riel Bestseller: FALSE Classic: FALSE Copyright Permian Flag: FALSE Educator Flag Message: TRUE Exclusive: FALSE Pages: 4 Main Category: Partner Article Publish Date: September 01, 2011 Publishing Date Range: Older, Than 24 Months Related Topics: Exploring Related Topics: Innovation Related Topics: Education Source: Rothman Management Magazine Special Value: FALSE Subcategory: Innovation and Entrepreneurship Subject: Innovation and Entrepreneurship Subject: Learning, Innovation, Education Type Filter: PDF Type Filter: Hardcover/Hardcopy (B/W) Item: #ROT144 Pages: 4 Date : September 1, 2011 Publish Date: September 1, 2011 Source: Rotman Management Magazine A few years ago released a founding report warning that India and China have trained thousands of innovators a year than the Western world, and urging the U.S. to pay more attention to science, technology, engineering and mathematics (STEM) education. Although the movement has since gained momentum, the authors show that there is little evidence to support it. They argue that great innovators such as Facebook founder Mark Zuckerberg embrace both science (how things work) and art (how people work), and in addition, they learn to think in ways that allow them to build new models that connect the two realms. Learning models of the potential skill of integrative thinking, they argue entails, goes beyond hysteria about STEM and nostalgia for liberal arts. The main objective of modern education should be to create integrative capacity and the country that builds it first and best will enjoy the benefits of prosperity. NASA Image/Shutterstock In 1925, Edwin Hubble blew all thoughts when he revealed that the universe was more than just our solar system. He did it again in 1929 when he proved that it was still expanding and therefore had a beginning. The space telescope, which bears its name and launched into Earth orbit in 1990, allowed scientists to view distant galaxies and calculate how long our universe has been around: nearly 14 billion years, according to NASA. On the other hand, scientists are still trying to figure out the answers to these 14 incomprehensible mysteries about the universe. GiroScience/shutterstock It is impossible to overestimate the importance of the Hubble Space Telescope when it comes to our understanding of the universe. Another of his critical discoveries: Dark energy is not just science fiction material. In fact, not only is dark energy very much there, which is about 70 percent of all energy in the universe, but, adds NASA, it also makes the universe expand faster as time goes on. REDPIXEL.PL/Shutterstock Black were another hypothesis straight out of sci-fi books until the Hubble Telescope helped prove the existence of what NASA calls exotic objects with large amounts of mass near their centers in 1994. NASA has discovered one of these supermassive black holes lurking in a huge galaxy called Messier 87.55 million light-years away; it measured about 6.5 billion times the mass of our sun. Just last spring, the Event Horizon Telescope and seven other people captured this black hole and its shadow for the first time. Supermassive black holes, with their strong gravitational pull, are thought to be at the center of most large galaxies, including our own. While their existence is now a fact, here are some scientific myths that have been proven wrong. Vadim Sadovskiy/Shutterstock Although the presence of a large body of water on the surface of the icy dwarf planet has been suggested - if not yet explicitly confirmed - from images from NASA's New Horizons mission, this has caused a real stir among scientists. They called it unexpected and say it opened up the possibility that the oceans could common to other cold cosmic bodies, PRI reports. So, you ask? You? Where there is water, there is also the possibility of life, past or present. Vadim Sadovskiy/Shutterstock In 2018, NASA's Mars Curiosity rover made two amazing discoveries: it discovered organic matter embedded in some rocks of the Red Planet, as well as methane in its atmosphere. In our endless quest to determine whether Earth supports the only life in the universe, the findings on Mars have given researchers considerable hope that it may once have been home to some form of ancient life. Manjiv/shutterstock In 1989, NASA's Galileo spacecraft was sent to study Jupiter, which it circled 34 times during its 14-year mission. He made many exciting discoveries about the planet, including the fact that its ring system was made up of dust from meteors crashing into four internal satellites. It also showed that Jupiter's outer ring was actually two rings. Even such small revelations help scientists piece together how our universe works. While this NASA discovery may not affect our day-to-day lives, others do. For example, these 15 everyday objects that you had no idea were made by NASA. Media union/shutterstock Do the words climate change have been part of our daily lexicon, since 1986 we've been talking about the dangers of holes in the ozone layer - an atmospheric shield that protects us from harmful radiation emanating from the sun. And it was NASA that developed a method to measure ozone depletion and attached instruments for this purpose to the space shuttle. This revolutionary work eventually paved the way for an international treaty in 1989 that banned ozone-depleting chlorofluorocarbons. Mihai-Bogdan Lazar/Shutterstock Stars are born in clouds of dust... scattered across most galaxies, according to NASA. And while we see the old guard flickering there in the night sky, for a long time we didn't know much about the places where they first appeared. Spitzer's space telescope, with its infrared sensors, cuts through the haze and sends images of the molecular hydrogen cloud Rho Ophiuchi and its 300 baby stars to Earth, allowing astronomers to study how they form. Don't miss these other astronomical facts that you never learned in school. The Afellon/Shutterstock Planets and The Sun in our solar system once made up our entire understanding of what existed, but NASA has proven that there is much more to the universe. In partnership with many scientists and other space agencies, NASA is working diligently to develop a map of everything that exists, and it is much more extensive than we imagined 100 years ago: an estimated 200 billion galaxies, each containing its innumerable number of planetary systems. r.classen/shutterstock Loss forests and shrinking lakes are known to us. But with astronauts our planet from space from early mercury missions in the 1960s-about 400,000 in have an incredible record of all the ways our planet has been changed because of human activity. These images gave an unprecedented insight into the changes taking place on the Earth's surface, according to NASA. This science allows us to understand the pressures of things like climate change and try to figure out how humans can work to mitigate the damage we have caused. ROSITO/Shutterstock Once for a time, we believed that the earth was the only place with volcanic activity. In 1979, NASA's Voyager 1 spacecraft flew past Jupiter's Moon Io and took several images. As a result, it sticks plumes of gas coming from its surface. This was the first evidence not only of a cosmic volcano, but also of one that actually erupted in real time. This gave scientists an idea of how lands and worlds are formed, something that is necessary for a genuine understanding of our planet and universe. If you think you know everything about NASA, think again. Here are 13 misconceptions too many people have about NASA.
