Students expand their understanding of functions by studying polynomial, logarithmic, and trigonometric functions. These new features, together with linear, rectangular and exponential functions, are used to model a variety of problems, including compound interest, complex numbers, growth and decay, projectile movements and periodic phenomena. The polynomial and rational feba is extensively covered, including advanced factoring and polynomial long division. More accurate work is included with probability that focuses on the use of conditional probability. Extensive statistics work is being done to help students understand how population parameters can help to infer the characteristics of the population. This course is in line with the common basic standards of Algebra II. Students in this course will explore a variety of topics within the algebra including linear, exponential, square and polynome equations and functions. Students achieve a fluent resolve of linear and rectangular equations as well as manipulation of polynomials using addition, subtraction, multiplication, and factoring. Students understand the main differences between linear and exponential functions. Students learn to model problems using algebra, functions, sequences, probability, and statistics. This course is in line with the common basic standards of Algebra I. My Products Linear features are reviewed in the common Core Algebra I in this 7 lesson unit. A series of slope-cutting and point-tilt forms are both used and applied to linear modeling problems. A linear function in reverse, piece and piece form is developed.
