As soon as the children enter the picture, family life becomes chaotic fast, juggling their schedules, figuring out responsibilities, and getting help from other parents can all make things easier, especially if you're using the technology already at your disposal. Setting up a routine for nights out. You should set up a night routine for your child so that they get the sleep they need, prepared for the morning, and avoid delays with the rest of the day's schedule. Make a night checklist for yourself and for the child who also sets you up for the next morning. For example, the list could include, among other items: Decide breakfast and prepCheck weather forecasts and plan clothes for yourselfPlan clothing bags for tomorrowBrush teethSet children's alarms on the morning Set my alarm on the morningFet checklist in apps like Habit List and Habit Streak Plan to cross out items that receive automatic updates the next day. The checklist is on your phone, so let your child know what will happen next in the routine while they do their current task. The routine will eventually become a trigger to fall asleep at a certain time. The Mayo Clinic says that your child should sleep 9 to 11 hours, and children need another 2-3 hours of sleep, so set the alarm accordingly. If you have more than one child, you should stagger bed time, suggests Dr. Laura Markham Aha! Education. You get a special time to connect with every child alone that your kids can count on. You're more likely to hear what's bothering them. And you get a special time with your eldest child who keeps you in touch at that difficult time when he's moving into his teens - and peer problems can howt his relationship with you, even if he desperately needs to stay anchored to you. In addition, the staggering bed time also means that you can set different wake-up times, allowing you to avoid the bathroom rush in the morning. Use the Google Calendar for color code and automate your family schedule Ever since you prepared the previous night, your morning should be easy. For the rest of the day, use the Google Calendar to plan everything, and share a copy with your spouse. For parents with multiple children, ask each child to choose a different color for the calendar color code. And while you're at it, assign this color to a child outside of the Google calendar too. For example, choose a school or personal belongings that match the color the child has chosen, so it's easy to spot whose stuff is making a mess in the living room or whose towel hasn't been hung back up. Over time, it will become an easy visual association for all. As an only child, I don't how quickly the brother rivalry began. But when my children were... MoreIn addition to introducing the schedule, Parent Hacks recommends telling your child to choose what they want to do at this time. It teaches them organizational skills and saves you from them to their Trapped in that nagging circle of hell: Do your homework!, Dress for karate!, you should read for half an hour!, which is invariably accompanied by nagging (them, not mine). Using the time management chart, children can plan their OWN time. I remind them that 4:00pm has arrived, but they can't whine to me about the schedule because they did it! It also allows them to see exactly how much free time they really have. It's easy to set up with Google Calendar. You must first make maps in the Google calendar with all activities and how much time they take (and be sure to consider driving there). Then ask your child to sit with you and let them choose which activities to put in which slot. Stimulating evening hassle and managing the gadget Time linking the task with the reward is the oldest trick in the book. Apps like My Job Chart and Choremonster allow you to make job lists and assign points to each task. Points can be redeemed for a fee (which may even include Amazon links that you authorize). Children can spend these points on any award of their choice, and even share some with charities. My Job Chart is a web app with apps for iOS and Android, while Choremonster is a web app with apps for iOS and Windows Phone.If you want to limit your children's time on your computer, Parent Hacks suggests using your device's built-in parental control to work. On your PC, you can even control your time by setting up a separate user account for your child and using built-in features. For example, in Windows, go to the user account dashboard and family security - Family Security - User Settings - Here you can set the time allowance for weekdays and weekends, as well as a curfew when the computer may not be accessed. For our family, this will not only help us limit the total screen time, it also eliminated the fights between children about whose turn is to use the computer. We have a diagram that shows when each person's time slot and the computer registers them when their time expires. Although they sometimes whine when their time ends in the middle of a game or video, they become better at managing their time at the computer. It also forces them to get up and move around, instead of wasting all their on-screen time in one session. It's not that simple on a mobile phone, but iOS has a few good options for limitations, while you can use third-party apps in Android. In fact, this guide will help you set up no annoying parental controls at all your Dear Lifehacker, I've been busy playing Grand Theft Auto III on my iPad, and I don't want my kids to read moreThere also DinnerTime for Android, which allows parents to remotely lock children's devices. You can set certain periods when the app automatically disables your child's device, or use the remote switch to temporarily disable it. Dinner should be a family dinner And this app will ensure that your child is not glued to his phone at the table. Rely on other parents The whole parent learns very quickly that they need the help of other parents if they are going to go through raising a child. Start or join your parent co-op. In addition to sharing information and meeting new people, you can even save money on babysitters, taking turns with each other's children. You can use a spreadsheet to track the hours people have been babysitting, so it's a fair exchange, but let's face it, it can't work that way. Taking care of each other's children is a matter of trust, so let the technology take a back seat. Date nights can become prohibitively expensive once you require a babysitter, but starting ... Read moreShare important contacts (such as a nanny or teacher at school) with everyone in the group and numbers being fed into your child's phone for emergencies too. An app like ContactBox for Android and iOS will allow you to create and share lists of contacts that everyone can update as needed. So you know everyone has the right information. You can also rely on the collective wisdom of other parents and experts to know what is safe to watch, play or read for your child. Common Sense Media tracks movies, TV shows, apps, and games, and uses independent reviewers and parents to highlight things like offensive language, violence, nudity, or other adult content. Use Cozi to get a full picture of family actionY can use the free Cozi app to perform some of the organizational tasks listed above. For example, it imports Google calendar records, has its own to-do list and product list, and a magazine to capture and share family moments. Although it has basic features, it doesn't always have small nuances that make other apps worth it. For example, there is no remuneration system to tie to housework or any parental control. Anyone, maybe it's just me, but the default Google Calendar interface is nicer to use than the Cozi calendar. Also, Cozi may not be for everyone; for example, it is redundant for small families as a couple with only one child in elementary school. The winning quality of Cozi is its cross-platform support. In addition, it works with other services such as Google and Outlook calendars, sends reminders via SMS or email, and more. The ease of access with any device makes it on-the-go kitchen bulletin board, Web/iPhone/Android/BlackBerry: It's hard enough juggling one busy schedule, not to mention those... MoreIn the case The version is not enough, the paid version of Gold costs \$29.99 per year and opens a recipe box, a birthday tracker, notifications of new events, shared contacts and removes ads. Photo iluistrator (Shutterstock), Ralph Hoogaboom, woodleywonderworks. I recently took a part-time voluntary position working for the DevOps team for a useful engineering team dedicated to combating COVID-19. Group Group in a warm model that relies on self-organization as a key concept in providing the best projects, both come to light and fruitful. There are many aspects to take responsibility for a part of a globally distributed engineering organization that reflect exactly the work I do with leaders who want to mature aspects of their engineering organizations as part of my regular work with my clients. If you're an engineering leader who has a new found responsibility for organizing and mature organizations in disarray, whether it's design in a swarm of models, or without intent, as in most companies, think of it as a cheat sheet to achieve sanity from the chaos. Meet ALL there are many books and articles about what needs to be done in the first 90 or 100 days, but sometimes one is not that long. If I were to wait 90 days before making decisions with useful engineering (which emphasizes a quick response to current needs), the virus would be past its first peak in the United States. People are dying today. I hope your situation is not so terrible. Many organizations have deadlines that are beyond our control, such as board expectations, promises made to customers, and other reasons why you also can't have 90 days. Meeting with everyone in the organization can be very difficult depending on the size of the organization. From the beginning it is important to meet with everyone, or at least as many people as possible, and take good notes at each meeting. First, people may be uncomfortable with things that are recorded, so it's important to explain how it allows you to look for patterns in an organization, and how it's the best way to make things better. If the organization is in disarray, people will appreciate it. Don't just meet with direct reports. In you can take the opportunity to hold meetings at pass level to get as close to the true information as possible. According to Iceberg Ignorance, team managers see only 3% of the problems! As the new leader of a chaotic organization, you don't want to make decisions while missing out on 91% of the problems that need to be solved. So it's important to meet as many engineers as possible at the staff level to have the richest data set from which to move forward. Describe expectations in order that you met the people closest to the information, should be a good understanding of their strengths and weaknesses. An important result should be a pretty good understanding of who stars and who bottlenecks (hopefully in the theory of limitations sense). It is time to set expectations for the teams. The teams don't know you and you barely know them, so it's time for them to understand you as a leader. I usually ask questions about what they spend their time on, what they would like to do, and that one thing we could change, make things things things This shows that the aim is not to lay the blame, but to improve the system. Being able to identify clear expectations for a team will have a lot to do with gaining the trust of your new organization. For example, one of the expectations I always try to set is that our job should be focused on meeting business goals, not on making sure that everyone works 40 hours a week. Align on the axesIf you need to shuffle the organization, which is likely to be more chaotic, it's important to align commands around one axis. By this we mean that teams should be held accountable for a certain flow of values. Often organizations that are chaotic have problems with delivery and everyone tries to do every thing. Switching context is bad for computers, and it's bad for people as well. As we have already said, in order to be productive, workers need blocks of time without interruptions. If, instead of allowing teams to work on a lot of different things, we organize around the flow values they provide, they can provide focused work that is constantly improving and reducing context switching to a minimum. This will help minimize the chaos that would otherwise result. An example is how in the group Helpful Engineering DevOps, instead of all engineers working for everything, we began to organize around specialties and interests. We have teams assembled to support all three major clouds as well as those around specialized skill sets such as authentication, architecture and security. There are also project liaison teams that are appointed for specific projects and who work with the major groups whenever they need to coordinate activities that can be centrally used for the benefit of all. Clear blockersOha of the best advice I got from the boss many years ago was if you succeed, I will succeed. There are many possible reasons why a chaotic organization may have failed in the past. It is your job to make sure they have all the resources needed to succeed and as many obstacles as possible cleared of their path. It's not good to listen to everyone, understand their problems, reorganize teams, and then leave them to solve their own problems. Here, our instincts towards the Servant leadership have the opportunity to shine. This is where we get to apply systemic thinking and Jin Kim's first way is DevOps to try to optimize the flow of work through the system. Part of this is inherent in our new organizational structures, and part of it is our active participation. Meet, meet, meet in the organization Helpful Engineering DevOps, we have a daily standup, every day. The urgency of the problems trying to decide, too big to do not do it. This is a forum for people to discuss the work that has been completed, upcoming work items, and blockers who need help someone in my position. This meeting is 100% optional. Taking on a new organization, as opposed to fighting a pandemic, it's important not to meet on weekends, so we don't want people to burn out. Because the structure of the organization is new and many team members are probably working with each other for the first time. It is important to more report on the rapid pace of change taking place around them. Too little communication and a rumor mill is easy to start. By applying regular, consistent communication, we can provide a high degree of consistency among all teams in the organization. This minimizes duplication of work, makes roles and responsibilities clear, and allows each value stream to perform its specific area of responsibility well. At Helpful Engineering, I had people inform me that they would write a private document and send it to my review. I stressed that I consider transparency a first-class citizen in a volunteer organization and in the point they were talking about. It would be better to just share it with the whole team from the beginning for feedback (and I'll be making a point of being one of the people providing feedback). Save the ExplosivesWhile we're talking about changing the alignment of the organization into structures that most likely never existed before, that doesn't mean it's important to blow up the whole organization. Part of our discovery process is identifying solid leaders, so it's important to use these individuals to our advantage! If it is not a very small organization, it will be almost impossible to track all the different commands, work elements, etc. in which case we must remember to delegate. If we show trust in people we can trust, we can preserve many aspects of the organization that people can relate to from the previous structure. This sense of familiarity can be powerful to give people a sense of grounding as they move through rapid change. Embrace uncertainty There is no doubt that we are moving through a time of great uncertainty. I've always called myself an opportunistic leader because I've always seen a lot of opportunities in chaos. If we can get through this chaos, we can often find ourselves in a much better place than we were before. I hope my experience of navigating the chaos will be helpful in combating the rapidly changing global pandemic. You don't need to work in such an environment, however, to work out your own serendipity.
