Hillox, RJ, Bennett, C. and Mponda, O.N. (2012) Bambara Nut: Overview of Use, Market Potential and Crop Improvement. African Journal of Harvest Science, 20 (1). 1-16. ISSN 1021-9730 (Print), 2072-6589 (Online) Official URL: Abstract Bambara peanuts (L. Verdc.) originated in West Africa, but were widely diverse throughout sub-Saharan Africa's semi-arid semi-arid region (SSA). Sharing high nutritional value with other widely consumed legumes, bambara has an attractive taste that is reflected in demand from small local and niche markets. Despite the high and balanced protein content, bambara remains underutilized because it takes a long time to cook, contains anti-nutrient factors and does not dehull easily. Bambara is well inferior in conditions that are too arid for peanuts (Arachis hypogea), corn (zeya mai L.) and even sorghum (Sorgo bicolar). Its drought resistance makes bambara useful legumes for inclusion in climate change adaptation strategies. Existing bambara products are not well promoted locally or internationally, and new products are needed to highlight its nutritional and culinary benefits. A number of bambar projects, which have involved several FSA countries since the 1980s, have failed to stimulate a sustained growth in the production of this crop. The lack of functioning value chains is a factor in this failure, as available market points can be a necessary incentive for small households to obtain improved seeds and invest most of their land and labour in the crop. There are few documented data on bambara trade, but indirect data indicate significant international demand. More research and development in the market should therefore be paid, and more market-led crop improvement programmes should be implemented in order to make more of a contribution to household income and rural development in the FSA.
