Download - See Gardner, Howard - Multiple Intelligences - Theory on Practice.pdf as PDF free The theory of several intellects is a model of the concept of the mind, published in 1983 by Howard Gardner, a professor at Harvard University. Intelligence, he said, is not a unitary set that combines different specific capabilities, but a network of autonomous, relatively interconnected sets. For Gardner, the development of some kind of intellect depends on three factors: biological factor, privacy factor and cultural and historical factors. For Howard Gardner, intelligence is a biopsychological information processing potential that can be activated in one or more cultural frameworks to solve problems or create products that are of value to this framework. Thus, from this point of view intelligence is not something that can be seen or said: they are potential - presumably neural - that are activated or are not based on the values of a given culture, the opportunities available in this culture and the decisions made by each person and/or his family, their teachers and others.
