According to Noah Rasheta Updated September 18, 2017 Access to your iCloud is something you can do in several different ways, including through your browser. Get access to iCloud with the help of a multimedia expert in this free video clip. Source: Joe Marin/Android Central While I love my Android devices and Google ecosystem, I also have my feet firmly planted in the Apple world as well. I spend about half of my time working on iMac, I have an iPhone in addition to my Android phones, and many of my family and friends on Apple devices as well. I suspect many of you are in the same boat. If you have iCloud calendars that you want to access from your Google calendar, what do you do? It's actually quite easy to move this data over; I'll show you how to do it. Open calendar.google.com in your web browser. Source: Android Central In a separate tab, open the icloud.com. Sign up for each account and confirm your identity as needed. On icloud.com, click on the iCloud calendar. Source: Android Central Find the calendar you want to copy and click on the curved lines (which look like a Wi-Fi symbol) to the right of the calendar name. Click on the checkbox for the public calendar. Below, click on Copy Link. Source: Android Central Return to the Google Calendar tab. From the left, click on the q sign next to other calendars. When the dialogue window pops up, click on from the URL. Source: Android Central Paste in a calendar link you copied from iCloud. When the link is pasted, change the text in front of the link with webcal at http. Click Add Calendar and you should see your new calendar appear in the Other Calendars section of your Google calendar. Source: Android Central If, for some reason, 11-12 steps don't work, you can insert a copied URL into the new tab. Then click Add when the dialogue box pops up. Source: Android Central You should see how your new calendar appears in the Other Calendars section of your Google calendar. Source: Android Central Now your iCloud calendar and previously added events will appear in google calendar views. However, if any subsequent changes to the iCloud calendar are made, you will need to repeat this process because they are out of sync with each other. If you want to keep ecosystems connected, you need to download a third-party app from the Google Play store and keep an eye on customization tips. We can earn commissions for purchases using our links. Learn more. The iCloud ecosystem is complex, and it's hard to know how secure your data is in the cloud and synced between devices. We'll go through the setup process and explain what each function does. As in iCloud, when you first set up your Mac, you should have been asked to log into your iCloud account. If you've already set that up, you're you to go, but if you don't enter you need to log in from the iCloud settings. Open the System Preferences app - you can click on the Apple menu at the top of the screen and select System Preferences - and click on the iCloud icon. You can also find the System Preference app in the dock and in the app folder. These are iCloud settings. If you don't make a report, you'll see this screen. If you already have an Apple ID with your iPhone or iPad, be sure to use the same one for your Mac, otherwise nothing will be synchronized between your devices. If you need to make a new account though, you can click Create Apple ID at the bottom to sign up. You can sign up with your own email address, such as a Gmail account, or you can make a new email address icloud.com. Any of them will create a new iCloud account that you can use on any device you want. What syncs automatically? The main feature of iCloud is to synchronize critical personal data on all devices (and back up in the cloud). Most iCloud features sync the following data on all connected devices out of the box: Your contacts Are a Meeting Calendar and Safari Data Reminders including passwords, open pages, and homekit history view access Notes you made in the Notes Mail app you sent and received, and projects you don't have to worry about any of them as long as you log in and the option is checked in the iCloud settings on your Mac. Make sure the settings are also included in iCloud settings on iOS devices, and any other device you sign up for in the same iCloud account, or you can run into problems. The main note to the photos with the photos is that there are two methods to back them up. First, iCloud Photos simply stores every photo you take in iCloud and syncs between devices. If your device breaks down, you can turn on iCloud Photos on your new device and reboot all photos in iCloud. My Photo Stream is different and only stores the most recent photos for a month to give other devices time to sync. This means that if you take a picture on your iPhone and don't use the iPad for a while, your photos don't sync with your iPad. Also, nothing backs up except last month's photos, so if you lose your device without iCloud Photos on, you won't be able to get your photos back. There is still use for my photo stream though, as storing every photo you take in iCloud will very quickly fill all the 5GB of free storage that comes with iCloud. If you have two devices that you use regularly, The MacBook and iPhone, having only my photo stream enabled can save you a lot of space at the same time with your photos back up on your MacBook. Just don't break them both at the same time. iMessage iMessage will not be included but all you need is to register when you start the app for the first time. Just make sure you log in with the same account you use on your iPhone or iPad, and make sure iMessage is enabled on all your devices. However, this won't sync any old messages that you might have on your Mac. To do this, you need to include Messages in iCloud. Once you've merged, click the Message button at the top of the menu and open your preferences. Open the blue iMessage tab at the top and make sure that iCloud messages are checked. As long as this option is on, your messages should sync no matter when they were sent. Again, you'll have to make sure that the option is enabled on all your devices in order to work properly. iCloud Drive iCloud Drive is used for everything else. TextEdit documents, your books, your system preferences, auto-scripts, the entire kitchen sink. If this is a document you made in Apple's native app, it's probably synchronized here. By default, iCloud Drive also stores Desktop and Documents folders, which can be very large. You can quickly turn up your iCloud account if you keep them on. And if you don't pay Apple \$0.99 a month for their 50GB iCloud plan, you'll be pinged with notifications every few hours telling you to buy more space. However, you can't just undo Desktop and Folders documents to turn off iCloud Drive because the process to disable is a lot harder than it should be. You can read our guide to disabling iCloud Drive without accidentally deleting your data. Although iCloud Drive takes up a lot of space in iCloud, it's a useful feature if you decide to pay for more storage. This will save all desktop folders and documents in iCloud and then delete old files that you don't use from the MacBook to save space. When you need a file again, you can download it from iCloud. So if you have an old MacBook with a small hard drive, you can pay a few bucks a month to give it some more respite. Ben Stockton If you switch from iPhone to Android, you don't have to ditch iCloud services like iCloud Mail. While Apple doesn't make it easy to set up, you can log in and use your iCloud email address on Android. While we recommend Gmail, you should be able to add your iCloud email address to most email apps. Before you start creating an App-Specific password for iCloud, you need to set up an iCloud account. Apple's two-factor authentication usually makes it difficult to register third-party apps, but Apple allows you to create a separate password for specific apps for use on Android. First, sign up to your Apple account Scroll to the Security section. Under the Password button for specific apps, click create a password. If you don't see this section, you should set up two-factor authentication in your Apple account. You need a recent Mac, Mac, or an iPad to do so. ANSWER: How to set up two-factor authentication for your Apple ID Provide a short but memorable description of that password (like Android login in) and then click Create. Save the password that Apple generates for you. You'll need to use this instead of an Apple ID password to complete the login process. Set up iCloud Email Access for Gmail With a separate app password, you're ready to sync your iCloud email with Gmail, the default email app for most people who own Android devices. Remember that this process should also work for other email customers, however; we cover more about what's below. First, swipe down from the top of the device to access the notification shadow, and then tap the gear icon. You can also access Android settings from your app box. In the main settings menu, click Accounts. Depending on your device and the Android version it works for, it may have a slightly different name like Accounts and Backup. If you're using a Samsung device, click the Accounts again in the next menu. For other Android devices, you should be able to skip this step. You see a list of accounts synchronized with your device. Scroll down and click Add account. Choose Personal (IMAP) with the Gmail symbol next to it. The Gmail registration screen is displayed. Use your iCloud email address and then click next. Use the password you generate for you (not the Apple ID password) and then click next. If your email address and password are correct, Android (via Gmail) is in the head and starts syncing your iCloud email account with your device. You may need to confirm some additional settings, such as how often you want Gmail to sync your email. To see if the process is working, start the Gmail app and then click the menu button in the top left version. You should see your iCloud email account with others; click on it to switch to it in Gmail. You can now use your iCloud email address to send and receive emails. Use Microsoft Outlook or other email apps that you don't have to use the Gmail app to get iCloud email on Android. There are other alternatives, such as Microsoft Outlook. The customization process is similar, no matter which app you choose. In the Outlook app, for example, click on the burger menu and then tap the add account icon (an envelope with a plus sign in the corner). Here, bring the iCloud email address and then click Outlook automatically detects that you're signing up with an iCloud account, so you don't have to do anything else. Enter the password and then tap the check mark in the upper right-right right to enter it. You should now be able to view and send emails from your iCloud email address. If you want to use another email app, look for an IMAP registration option when you sign up for your account or iCloud option. Use a generated password for registration process and you should be able to use your iCloud email as if you were on an iOS or Mac device. Device. how to check my icloud email on android
