Controlling your PC with an Android device is an increasingly popular option for those who want to power their desktop in the palm of their hand. But what if you want to manage Android with a PC? This can be very handy as it allows you to enjoy your favorite Android games on the big screen, or respond to messages without getting up. This can boost productivity and media consumption, and work like a drag party trick. Without further ado, let's count down seven amazing ways and apps to control your Android device with PC1. Join If you like the sound of continuing reading the web page you have open on your desktop on your phone when you visit the toilet, you should check registration. It's actually a tool that I use most often from a bunch! Join the Chrome App and once you've installed it on your phone, you can pair the two together. From there you can send a tab you read to your Android device, insert a clipboard onto your device, write text in the app on your device, send SMS messages, send files, take screenshots of your phone screen (especially useful if you're working on Android Authority), and more - not bad! It's not complete control over your smartphone, but for some apps I find it better since it's much easier and won't slow down your computer or crash on you. It also has several other abilities. For example, it works both ways and you can also ping articles back to your computer. You can then share your Chrome tab with your Android device and continue reading on go.2. PushbulletPushbullet allows you to sync multiple devices to share files and send messages. It also supports WhatsApp (sort of). While you will be able to send WhatsApp messages and see them pop up when you get new ones, you won't be able to get the message history. There's also a limit of just 100 messages (SMS and WhatsApp) per month if you pay. The pro version is a pretty expensive \$4.99 per month. For our purposes, there are better and cheaper options on this list. It has some unique features, too. This allows you to control multiple devices and engage in a kind of chat between them. There is a potentially good argument for Pushbullet as a performance tool for offices. But for our purposes - trying to control Android with PCs - there are better and cheaper options on this list. ScrcpyIf you were hoping to fully control Android with your PC, then you might have stayed a little cold the last two options. This one should be a little more of your alley, as long as you have a Samsung device. Scrcpy is an app that will reflect your screen and fully allow you to control your mobile device with your PC through or Wi-Fi (a recent addition). It's free, it's open source, and it doesn't require root access! It works very fast and has a lot of features too. It's a little less convenient than some of the other options on the list, with the developer recommending you build it yourself (requirement for Linux users). However, there are ready-made versions to download that will simplify the process. Vysor For those brave SCRcopy's DIY ethos, Vysor is the next best option. This app mirrors Android on your PC using Chrome, and it's actually pretty good. You can choose between speed and performance, but on wired communication at least, it's actually pretty fast. It also has some interesting potential for offices, like being able to share one Android device with multiple users! Like most of these things, there is a paid and free option. You get a lot more features and better performance if you go with a paid option. Wireless is only supported on a paid basis, such as full-screen and high quality mirror view. There are more that do similar things, of course, such as ApowerMirror. It's just a matter of finding the one you like the most.5 DeskDockLike Join. DeskDock doesn't reflect Android on PC - it gives you another way to control Android on PC. In particular, this app allows you to share a mouse with your phone or tablet. So if your phone sits next to your computer, you can just move the mouse to one side and it will switch to an Android device. This is useful for quickly opening and closing apps or browsing the web. It could also potentially be useful for developers who want to test the functionality of their app on a hardware device from one place. There is also a paid version that allows you to share a keyboard, clipboard and more. Alternative apps that do something similar include Share Mouse and Keyboard (original name) and Synergy - which apparently isn't quite what it used to be.6 AirDroidAirDroid is a surprisingly powerful app. In many ways it's kind of like combining all the features that we've seen here. You can send messages, share a clipboard, and download files through the control panel. You can also mirror the screen, keyboard and mouse! The mirror image of the screen is not as smooth as SideSync or Vysor, but it's good for quick firing from WhatsApp messages. Most of the functionality is free, but you will need to pay to remove ads and the 30mb file transfer limit. It costs \$2.99 a month though, which is significantly cheaper than something like Pushbullet.7. TaskerTasker allows you to customize triggers and events on Android. So we can set up our phone to do something automatically when it notices a new connection, notification or location change. Both Join and Pushbullet also have support Baked in, meaning you can call a range of phone features via SMS or web page. Tasker is an app that allows you to customize triggers and events on Android. There are many potential apps for this, whether you want to find the coordinates of your phone or use it to prank prank it just takes a bit of imagination. There you have: seven different apps and seven different ways to control an Android device with a PC. The best for you, of course, will depend on your workflow and how you would like to use your devices, but hopefully something here will prove useful. Did I miss the good ones? TeamViewer is also very good, albeit a bit on the expensive side! Let us know your favorites down below! If we had to make one small complaint, it would be that the face buttons are a bit on the soft side. The Xbox One wireless controller is an affordable and reliable choice. If you want a higher-end version with even greater perks, your best choice is a much more expensive but nifty Elite 2 Controller. Check pricing2. DualShock 4 Wireless ControllerReleased along with Sony PlayStation 4 in 2013, the dualShock 4 wireless controller took people by surprise. Not just because it's a good controller, but because of how many improvements there have been compared to the PlayStation 3's DualShock 3. This time around, there are proper trigger buttons. Analog sticks are as impressive as the convenient layout of the button with two analog sticks parallel to each other. Controller thin and ergonomic - a huge point in his favor compared to the cumbersome competition. The PS4 controller is equipped Battery too - something his Xbox Wireless rival doesn't have out of the box. Even with this battery, however, the DualShock 4 does not last as long as other wireless controllers. Also, getting dualShock 4 to work properly with your computer isn't as easy as turning on Bluetooth. Make sure to download DS4Windows, connect DualShock 4 to your computer, and run the program. This will allow you to zip up the card and more. However, if you only play Steam games, you probably won't need to install additional software to use the PS4 DualShock controller. You'll even find a headphone jack that lets you connect the headset directly to the Xbox 360 controller. Here's the wired version. And check here for a wireless controller.4. The Logitech Gamepad F310 Logitech Gamepad F310 is one of the cheapest entries on our list. Thanks to the ultra-affordable price controller, you can buy seven F310s for the price of one Razer Wolverine Ultimate, which you can find below. That doesn't mean there aren't some bells and whistles, though. Because of its plug-in and play character, the F310 works with many PC names. For those who don't, you can use Prolifer Logitech software to set up buttons and general control. You can even simulate the keyboard and mouse commands. This makes logitech the most versatile controller at this price. Its buttons are pretty responsive too, although their layout will appeal more to retro gamers and those from PlayStation. Razer Wolverine UltimateFor the most part, the Razer Wolverine Ultimate looks just like the Xbox wireless controller that frequents nightclubs. Sticking to Steam means that Pro Controller is recognized as an Xbox One controller. However, you'll need an 8Bitdo Wireless USB adapter if you're going to play games outside About how you use the Pro Controller, Nintendo's peripheral is good. The weight is reassuring, the offset analog sticks are fantastic, and the D-Pad is great for retro titles. We Are We The triggers were a little more activation, and the D-Pad could have more clicks to it. But it's a quibble for what is an excellent controller. Check pricing9.
