We can customize the style of code snippets and their text output using chunk `class.source` and `class.output` options, respectively. These parameters take the vectors of class name symbols (see section 11.13 for more information). For example, when a class is source and important, an HTML item containing a piece of code in the output will be important to the class. You can then determine the CSS rules for this class.¹¹ This can be useful if you want to highlight a specific piece of code or text output. The default HTML outlet R Markdown includes the Bootstrap framework, which makes it easy to change the look of the code and output, because Bootstrap has pre-identified some CSS classes for backgrounds: `bg-primary`, `bg-success`, `bg-info`, `bg-warning` and `bg-danger`. Below is an example using a piece of `class.source` - `bg-danger` and `class.output` - `bg-warning`, and you can see its output in figure 7.1. ---: Change the output of the chunk style:

```
html_document --- When you multiply the data frame, it doesn't necessarily return the data frame. For example, if you represent two columns, you get a data frame, but when you try to subsets one column, you get a vector: "r class.source'bg-danger, class.bgbg-warning - mtcars '1:5, mpg' to make sure we always get a data frame, we have to use the 'drop' argument. Now we use the piece option 'class.source - bg-success.' 'r df-drop-ok, class.source'bg-success - mtcars-1:5, mpg, drop - FALSE' FIGURE 7.1: Fragment of code and its text output with background colors defined by Bootstrap. You can also use arbitrary class names and define CSS rules accordingly. In this case, you'll have to include your custom CSS rules using the methods mentioned in section 7.1. Here's an example: ---: Assign custom classes to output fragments: html_document --- First, we set some CSS rules for the 'watch-out' class. 'css, echo'FALSE.watch-out - background: lightpink; Border: 3px solid red; font-weight: bold; Then we assign a 'watch-out' class to a piece of code through the class option. 'r class.source'watch-out - 1:5 mot, mpg' output style is shown in figure 7.2. FIGURE 7.2: A piece of code with a light pink background and a thick red border. If you want all the blocks of code in the document to use custom style, you can customize the class.source in global knitwear options, such as knitwear::opts_chunk$set (class.source and watch-out) you can apply multiple classes to code blocks. For example, with a class.source and c (importantly, warning), the code block will have two classes,
```

important and alert. If you want to decorate individual items in code blocks rather than whole blocks, you may want to consider using (Bodwin and Glanz 2020). With this package, you can identify different parts of the code (e.g. fixed lines, lines, names, and arguments) with custom styles (e.g., color, font size, and/or font weight). Bodwin, Kelly, and Hunter Glanz. 2020. Flair: Highlight, Annotate, and Format Your R Source Code. I use R Markdown's RStudio and the HTML option to create html output. However, the font used in ouput for simple text blocks is quite small, and I would like to change it to another font and increase the font size. Can anyone set an example of how to install a workable output font without much knowledge in html? So far I've tried the top of my document markdown, but it doesn't work. --- fontsize: 24pt --- r knit r-markdown Source B'rbel March 26, 2015 at 09:04 I think the team fontsize: the YAML only works for LaTeX / pdf. In addition, only three font sizes (10pt, 11pt and 12pt) are accepted in standard latex classes (article, book, and report). As for the appearance (different types of fonts and colors), you can specify the theme: . See the look and style. I think you are looking for your own css. Make a file called style.css, keep it in the same folder as yours. Rmd and include it in the title YAML: --- output: html_document: css: style.css --- In the css file you define your font-type and size: / Whole document: / body/ body font-family: Helvetica; font-size: 16pt; q / q Headers q/ h1,h2,h3,h4,h5,h6 q font-size: 24pt; jmj March 27, 2015 at 10:24 you can change the font size in R Markdown with HTML code tags zlt;font size q1 gt; your text This code is added to the R Markdown document and changes the HTML output output. For example: this is my text number1.It; font size, this is my text number. This is my text number 4/font/gt; this is my text number 5//font size. Just surround your text or add the right attributes. See the following example: zlt:p style-font-family: times, serif; font-size:11pt; font-style:italic> Why did we use these specific parameters during the calculation of the fingerprints? This will lead to the next result compared to this will work with Jupyter Notebook as well as Typora, but I'm not sure it's versatile. Finally, keep in mind that the html marker redefines the font style used by Markdown. Kareem Jeiroudi April 22, 2019 at 09:50 Change the font of the document's title and the names of the authors in markdown I use rmarkdown to create a pdf document with a conversion made either in RStudio or using render () in R. Can someone give me some pointers to change... The conditional color of the R Markdown font I can't find a way to include the dynamic colors of the font in the R Markdown based on the variable value (zgt;0, z0 or zlt.0). Can anyone help? I tried the if operator, where returned... Why does changing font size spoil the default HTML style? I use the standard style of HTML buttons (not allowed to use bootstrap or other sets). When I use the default font size, the button looks and acts nicely. However, when... Changing the size of the picture title font in the RMarkdown Word output I was recently asked to change the size of the picture header font in the RMarkdown HTML output and I got a very good response that uses this CSS method. I wanted to try the same thing, but on... Changing the size of the picture title font in the RMarkdown HTML output I would like to make the font size of all the signatures of the drawings in my R Markdown document smaller. Конечный результат-HTML, и я работаю в студии R.
