sturl/Getty Images Many of us buy a new boiler when we are forced: when one cold day we wake up without hot water or heating and the quotes for repairs come higher than expected. If your boiler is on the old side - the average life expectancy is about 10-15 years, but many start to lose efficiency after eight years - the most economical option may be to invest in a new one. Or, your boiler may work fine, but it may be that your current model just no longer meets your needs; whether it's hot water and heating or its size or positioning. (It may be more cost effective to buy a new boiler than to move an existing one.) So, if you decided to go for a new model, what do you need to do next? How much does it cost to replace the boiler? The cost of a new gas boiler and installation can vary greatly, from 1,000 to 5,000 euros or more. The Energy-Saving Trust quotes around 2,300 pounds for a typical replacement and installation. The price will depend on a range of variables: the type of boiler you go on: combi, system or ordinary, for example, and whether you change the existing setting. The bottom line will also be affected by any additional work; if you move its location, or additional parts are required. The installation rate varies between areas and between companies. If you decide to go with a larger supplier such as the likes of the Big Six - British Gas, EDF Energy, E. ON, Npower, Scottish Power, and SSE - or through a local installer, we recommend shopping around and getting at least three quotes to find the best deal for you. Find a local installer in the Gas Safety Register (GSR)All gas engineers must be in the Gas Safety Register, which means you can find your own local installer if you want. Choosing a local installer should mean that you can easily contact them if there is any problem - Energy Saving Trust recommends checking that they have a local office, have been in business locally for several years and have links to customers that you may want to consider. A local installer may be able to give you impartial advice on the boiler brand. You should also check that every engineer is authorized to perform and check their gas secure ID cards. It's also worth bearing in mind that some installers can be tied to certain brands, so make sure you ask upfront if that's the case. For convenience in an all-in-one service from a large or medium-sized company, you can choose a larger service provider. One advantage for some is that these companies have set customer service settings and complaints procedures that can give mental Make sure you check that you are not being sold any unnecessary extras (coverage for many years that are already included in the boiler warranty, for example). We recommend always checking quotes with local installers for comparison, and note that while will have their own engineers, they can also use subcontractors. Use the full digital service There are some all-in-one online alternatives such as iheat and Boxt that claim to offer fixed price quotes, calculated from you entering your needs and images that you upload, rather than having an engineer make a pre-quote visit to your home. Both offer the next day installation where it is available. Boxt GHI review BoxtThe process quote Our tester says he knew almost nothing about the boilers when he went to get the quote, but easily navigated the process - answering a number of manageable questions and uploading photos of his current setting (this is instead a pre-quote house visit). He had a call from a surveyor to check the part with the chimney, which was not clear from the photos. This did not change the quote, but it felt that it could be confirmed at the stage of uploading the photos if it was clear that they needed this information. The boiler installation, chimney and other necessary additional services were delivered by courier on the day of installation and a local certified installer arrived afterwards with the boiler. Its installation took half a day, but admittedly, its installation was not standard, as it had another work done on the spot at the same time. VerdictOverall, our tester was impressed by Boxt and said he would recommend the service to a friend, mainly to save the item's time. I found it a welcome digital update to what used to be a long, complex process. He noted that someone less used to online operations (uploading photos, for example, and not having a home visit) might find this a deterrent. Boxt say that if they encounter any problems when on the property to install, the customer has the right to cancel and receive a full refund. Saving money claimBoxt claims that its installation will save you money on a new boiler and install compared to the likes of the Big Six suppliers. The technical editor of GHI, Carrie-Anne Skinner, dug into these claims. She used the Boxt website to get a quote to directly replace the boiler for her property. Some of the kombi boilers she looked at offered nest training Thermostat (3rd generation) and Google Nest Mini as a supplement for 180 pounds. The thermostat only costs around 180 pounds, usually so effectively the deal gives you a Nest Mini for free (it's currently 49 pounds). However, it's only cost effective if you don't yet have a compatible smart speaker, and it's worth noting that the deal isn't available at all combis. There is also the option of supplementing Hive, but without any free extras. Using the same information, she received a quote from British Gas. It's 50 pounds more than Boxt, but British Gas doesn't say which boiler was priced before the home visit, so it's a longer, less convenient process. Another thing to consider is that British gas is working with Hive more So Boxt offers more choice when it comes to smart add-ons. Once installed, your engineer should always take you through how to use heating control and leave you with a certificate of compliance with building codes confirming that the boiler has been installed safely. Energy company commitment: Am I entitled to a free boiler? You can get a free boiler under the Energy Company Commitment (ECO), a government scheme in conjunction with major energy suppliers in the UK, to help with both cost and energy efficiency. The right to qualify depends on income, being on certain benefits or having an old or inefficient boiler. For more information, visit Ofgem's website. You may be able to find more information about this and similar content on piano.io sheet blower or vacuum is a versatile tool that can usually be found in your garage. It is commonly used to assist in cleaning the yard. While it may seem simple- just wave around to move those pesky leaves off your lawn- there's the right way to use them so you can get optimal results. Of course, that doesn't mean you'll never use the rake again. We still recommend that you keep the rake handy (if your physical condition does not allow you to pick up the rake). Knowing when and how to use a leaf blower/vacuum will save you time and effort. Just a few examples: If you need to sweep dry grass clippings, leaves or dirt from your driveway, patio, sidewalk, etc. quickly, then as long as you're not particularly concerned about picking them up as quickly, it may make sense to use leaf blowers/vacs. If pickup is a problem, use the store-vacuum instead. If you have a large lawn and it is covered with large masses of leaves in autumn, it may make sense to use a leaf blower/wak as a first step in the leaf removal process. That is, using a sheet blower/vacuum combined with a tarp, round most of the leaves in separate piles. For example: Starting from the far left corner of the lawn, kick most of the leaves in a heap, on a tarp. Don't be fussy: it's counterproductive to try to round every last sheet using a sheet blower/vacuum. When you have blasted most of the leaves in a heap in this corner of the lawn, fold the tarp over the leaves and remove the pile (you probably need help) by dragging the tarp away. Dump the leaves in the enclosure, where can be composted or from them in leaf bags, consider an alternative to removal: namely, mulching in place. That is, mulching a mower can make more sense to you than a sheet blower/vacuum. Just run a mulching mower over the leaves, allowing it to chew them into small pieces that will work as a kind of lawn fertilizer. Another alternative is to run either a regular or mulching mower over the leaves with a bag attachment and then dump them out of the bag attachments in leaf bags. Bag attachments for some mowers to hold more leaves than vacuum bags of leaf blowers/vacuums, so the work will go faster. Mint Images/Getty Images Such as everything else in life, no matter how comfortable the blower or vacuum may be there are drawbacks. This is especially true when it comes to lawn aeration. Leaves are not the only type of garbage you need to remove from the lawn. This should also be removed. Building this mim on the lawn can make it difficult to breathe. Lawn aeration is performed in the spring or fall helps to control the lawn thatch. The blowers/vacuums we use to remove the leaves in autumn do not, in any case, solve the issue of thatch. In contrast, if you use the rake sheet wisely, you can perform a sheet of removal and thatch-removal at the same time. What do we mean wisely? Well, if we're talking about an installed lawn, don't be afraid to lean on this sheet to rake some, applying enough pressure to dig your fingers into the little one. This will help dislodge some of thatch that has accumulated on your lawn, in addition to taking care of the leaves. Not that this medicine, in itself, is for serious problems thatch. But every little bit helps. George Doyle/Getty Images The devices in question are called blower/vacs because of their use in two different modes, of course: blower mode and vacuum, or vac mode. It's time to consider the possibilities of a blower/vacuum in vacuum mode. Frankly, most people find sheet blowers/vacs ineffective as a vacuum with the aim of, say, removing large amounts of leaves from the lawn. Because: They just don't vacuum a large number of leaves very quickly These vacuum bags don't have enough leaves to make them worth removing leaf targets (you find yourself constantly stopping to clean bags) However, however, it may make sense to use leaf blowers/waks in vacuum mode in some individual areas of the yard to remove small amounts of leaves, dry cutting, dirt, etc. where it would be difficult to use the leaf to use the rake; for example: Areas where leaves fall between the rocks. At the base of the fence where the leaves fall into the nooks around the house and outbuildings. On the decks you can also blow up the trash from such areas and then pick it up later. But why do extra work for yourself? You're You for your equipment to vacuum up the potential, so why not put that ability to work where it is really effective? Once you remove most of the leaves from your yard, you will still have some leaves to remove. And that's where the leaf rake comes into play. The best way to pick up these stray leaves is by using that old favorite, leaf rake. Techie die-hards who despise leaf rake in principle will persist and are desperate to pick up the remaining leaves with leaf blowers/vacs. But doing so just doesn't make sense, in terms of efficiency: leaves not very cooperative in such matters! The technology just hasn't come up with an inexpensive product, at this point in time, that replaces a low leaf rake for this purpose. Use a sheet blower/vacuum in vacuum mode to remove a small amount of leaves etc from narrow stains where the leaf rake will be difficult to use. Use sheet blowers/waki in blower mode (combined with a tarp) to collect most of the lawn leaves in piles, to remove by hand. Leaf rake is still the most effective tool for putting the finishing touches on removing lawn leaves, or for removing leaves in small yards. Leaf rakes offer an added bonus by helping you keep thatch under control.
