Screenshot: ProdigyMy son came home from school one day a few months ago asking if he could play another new video game a friend told him about. But it turns out that this game, called Prodigy, is both a really funny monster, fighting, research game, and a game of mathematical skills. Prodigy is a fantasy-style game that is a kind of cross between Pokemon and Minecraft creative mode, with some mathematical equations thrown in to make money to set up your home, buy pets or earn prizes, they have to defeat the monsters. To defeat the monsters, they have to answer the math questions correctly to earn spells. The questions, which Prodigy says coincide with state-level 1-8 classes, including Common Core and TEKS, are tailored to each child's strengths and weaknesses: Prodigy determines your child's skill level through a placement test, giving your child more complex or easy questions when they play to find out where they stand. The placement test starts immediately and runs in the background as you play. It starts in one class below the class that you or your child chose when setting up your account and then works up to determine your child's actual level of class. After the test is over, the difficulty level continues to adapt by revising the preliminary requirements or jumping forward depending on how your child performs. This is my son's house, which you may notice is basically just a large room with a bed for each of his friends so they can sleep. Plus a bookshelf, because every house needs a bookshelf. Screenshot: ProdigyMy's son, who is 9 years old, is now most interested in helping some creatures called Floatings rebuild their home, which was- I think?- destroyed by a puppet master. I don't know there's much going on in this game: battles, rescues, gems, mythical creatures, shopping, decorating and traveling to other worlds. It often sounds like a different language to me, but I can tell by the excited way he talks about the game that he's into it all. As for being able to communicate with other users on the Internet, which is always one of my main problems, Prodigy has the ability to exchange messages, but it's pretty blocked: Although the chat and friends list can't be disabled, your students can always play offline mode where all social elements are disabled and the game is populated by computer players. It's always from the worlds selection screen after logging in. Only pre-determined offers that were deemed safe were added to the game. Users can't print or send whatever they want. This was put in place for privacy and security reasons for students/children. No personal or inappropriate language can be hired and seen by any other user. About 93% of American adults have some degree of mathematical anxiety. I recognize that I am part of this group.... MoreKids is free to read, but some features and options will not be available as part of the basic membership. So if they like the game, keep in mind that they'll pretty quickly want to switch to premium memberships for extra bells and whistles (priced at \$4.99 per month for the year, \$7.95 per month for a six-month membership or \$8.95 on a regular month-to-month plan). We started with a free membership and I was tracking how much it actually played for about a month. Prodigy provides weekly summaries of how much they play, what math skills they practiced and how experienced they were in different categories. As soon as I was sure my son was sticking to it, I upgraded him to a monthly membership. Now that he's had it and used it for months (he actually spends more time in the game now that the extras are unlocked), I can upgrade it to a six-month or annual plan. My son mostly likes to play the web version of Prodigy on his Chromebook, but he's also available as an app on iOS and Android. When I asked him if he recommended it for other kids, he said he definitely does because it teaches kids to do math and it's awesome. Meet the smartest parents on Earth! Join our parent Facebook group. This story appears in the July 1999 issue of the entrepreneur. The clash was horrific. In high school, math was easy for me - I could just sit for an hour and look aimlessly while an instructor scrawled his enigmatic chalk symbols. But when my lack of training met with my first college math exam, the twisted metal of my mind created a big fat F.A tutor changed my world. The driving force behind Cumon's math and reading centers is the idea that every student should have that opportunity. The centers are designed to help students of all ages understand what is seemingly incomprehensible. According to my observations, the Kumon system, which originated in Japan, is a series of tests structured to create gradual success, so that every student feels to achieve. These masters of mathematics and reading have created a learning structure based on constant repetition and measured growth. Students set their own pace, review their past work and then check again. Becoming a franchisee is an interesting process. It starts quite normally with the end of the application. The candidates then sign the training agreement and spend a busy seven days in the regional training center. Interns take knowledge tests and are assigned homework. You don't pass exams, you'll see Cumonn teaching methods up close and personal while you're doing. Homework takes many hours and is so intense, even your kids will feel sorry for you. Your research will also consist of business plan. If your site is approved, you will pay just \$800 for the rights to open the Kumon Center, plus \$200 for the training kit. Over the next 12 months or so, you will be immersed in your Temporary Training License Period (TLP). In addition to continuing tests, you will have to pass business benchmarks and attend training meetings. You will also have to pay a higher royalty fee of \$31.50 per student per month during TLP. To pass this stage, you must have 30 full math students and 20 full-time reading students at the end of the first year of your business. I think Coomon is more concerned with educating children than making money. It does not offer protected areas and reserves the right to host both franchises and company-owned centres wherever it wishes. Also, you can't work in more than two places. While teaching America's youth is a commendable enough goal, let's make some math for the more hedonistic among us. The recommended tuition for a full-time student is about \$75 per month plus a one-time registration fee of \$30. Assuming you have 50 students for your twelfth month of work - enough to pass your TLP - your gross earnings for the month will be \$3,750, excluding registration fees. The franchisee I interviewed had 165 students, totaling \$12,375 a month. Once you pass the TLP, you will be required to pay the franchisor \$28 per student per month. That leaves a gross profit of \$2,350 with 50 students - \$7,755 with 165 students. Subtract rent for about 1,000 square feet of space; Marketing costs and wages for local students who work for you after school. Kumon can provide you with income potentially better than the teachers you earn will supplement. The franchisor faithfully assists in your growth and will even help franchisees with rentals for up to 12 months during the first 36 months of operation. Kumon - the top-ranked various franchise training systems and No.23 overall in Entrepreneur's 1999 Franchise 500® - are low-cost features that have been refined for more than 40 years in the business. The franchisor offers marketing and financial support, and boasted 2,617 franchise locations in North America as of March 1999. Todd Maddocks is a franchise lawyer and small business consultant. (800) ABC-MATH Think Through Math (TTM) is an interactive online math program designed for students in grades 3-Algebra I. It was created in its current form in 2012 and was a spin-off of the popular Apang Math program. The program provides users with both direct training and correction. Through Math was designed to prepare students for general basic government standards and rigorous standards. Students Students in a unique way based on their class level. Students are also provided with an adaptive assessment that prescribes precursor activities aimed at developing the skills needed to improve their skills at the class level. These actions are added to the path. Each lesson on the road is divided into six unique components for advanced training, including pre-quiz, warm-up, focus, guided learning, practice and post quiz. Students who demonstrate skill on a pre-quiz for a particular sub-flood can move forward. Think Through Math is a revolutionary program for teaching students. It combines a unique combination of adaptive assessment, professional development, student motivation and individual live learning. The entire program aims to improve classroom learning by filling in the gaps that a particular student can have and prepares them to meet the rigours of common core government standards. Think Through Math makes it easier to add one student or class by downloading a data template. It has terrific reporting that makes it easy to control individual students or the entire class progress. It also has a stunning and easy-to-use interface that makes it easy for teachers and students to monitor usage, test performance, compare achievements, and test goals. Think Through Math allows and encourages students to access the program at home after school and on weekends to maximize the impact of the program. Think Through Math allows teachers to send messages directly to individual students through the messaging system. Students can only receive these messages. They can't send or reply. Think Through Math provides both direct training and intensive recovery through the same program. It puts each student on a path that contains the skills they need to succeed at a certain level of class. It also provides students with an initial adaptive assessment that assigns precursor activities designed to eliminate the skills needed to do the necessary work at the class level. Think Through Math constantly monitors and adapts to the person, adding new material based on the performance of the entire program. Think Through Math allows users to create and personalize their own unique avatar. It provides continuous contests in several categories for stunning prizes such as iPod Touch, gift cards, etc. it also allows teachers to set class goals for a pizza party or ice cream party. Students can donate their points to this goal, and when the class reaches the goal, the teacher will receive gift cards to help purchase goodies for the party. Think Through allows students to donate their points to charity. \$10,000 points and \$1.00. Charities they can donate to include St. Jude Children's Hospital, World Wildlife Fund, Make-A-Wish Foundation, Boys and Girls Club of America, Wounded Warriors Project, Big Brothers Big Sisters Sisters PACER National Center for Bullying Prevention and the American Red Cross. The program provides users with incentives and rewards. Every time they complete an activity, they earn points. They can use their glasses to buy new features for their avatar, donate points to charity, or they can give points to the goal their class is trying to achieve, as discussed earlier. Think Through Math provides users with badges to achieve goals or achieve the values within the program. There are four level icons including bronze (the simplest), silver, gold and diamond (the hardest). Students can see both the icons they earned and the ones they didn't earn. Then they can work towards getting the badges they don't have. Think Through Math provides students will print certificates every time they pass an individual theme. Think Through Math is a common core aligned in content, process, and evaluation, which encourages critical thinking and problem-solving. It gives students access to calculator, critical math formulas, and key terms of the math vocabulary at any time in the program. Think Through Math has an audio tool available in English and Spanish that allows you to read questions and answers to the choice of struggling readers or learning English. Think Through Math gives students the opportunity to demonstrate excellence by taking a pre-quiz on a specific topic. The preliminary quiz consists of eight questions. A student who demonstrates his skills on a pre-quiz will immediately move on to the next lesson. It provides students with three warm up activities aimed at reinvigorating previous knowledge by examining the math skills you've already mastered, but it is essential for the new skills you will learn. The program provides you with step-by-step illustrations and explanations to solve each problem no matter whether you get them right or wrong. Think Through Math provides students with a three-question guidance teaching activity allowing them to work through new math. It also provides students with several assistance functions as part of the Activities Guidance Learning. It comes through coach training. To get help, just click on the training coach at any time. If you haven't answered the question yet, explaining the concept with the visual will pop up to help you. If you answer the questions incorrectly, the explanation of the concept will pop up. If you still don't understand, you can click again on your coach training. The box will be a pop-up asking you if you want to work with a teacher. Click the teacher button and you will be able to connect to a live certified math teacher who will get through the process and answer any questions you have. If you have audio and microphone, you can have a direct conversation with them. If you don't, you can communicate with each other in the text Think Through Math provides students with ten questions of Independent Practice Activities, allowing them to practice what they have learned and use feedback to understand the concept further. Think Through Math provides the student with eight post-quiz activity questions, allowing them to demonstrate their understanding of the new concept. Students are given only one attempt at question. If they fail, they will have to retake or correct the concept. The Review Report allows you to track how many lessons each student has tried and gone, and gives you a pass rate percentage for both target and precursor lessons, while the student detail report provides you with a detailed progress report for each individual student. The Individual Path Report provides you with a detailed overview of the progress that an individual student makes on their own path, while the standards report allows you to track students' progress based on individual government standards or common core government standards. Think Through Math does not publish their total program value. However, each subscription is sold as an annual subscription fee to the place. There are several other factors that will determine the final cost of programming, including the duration of the subscription and how many places you will buy. Think Through Math is a research program. Its development spans more than two decades. It is based on helping students effectively analyze and solve the problems of words. This is done on the basis of the principles of active problem solving, explicit learning, gradual release, development theory, prototype categorization, mastery training, proximal development zones, evaluation and differentiation, as well as established examples. In addition, Think Through Math has been the focus of several critical field studies involving more than 30,000 students in seven different states.
