Becoming a mother means that you will pretty much carry your heart on the outside of your body for the rest of your life. You will constantly worry about your child. You just can't believe it, even if you tried. It's an innate quality, I think it's women who are embedded in our DNA. It's even worse when you're the first time a mother is desperate to learn the ropes of a new role that can be considered the hardest job on earth. Maxwell had just turned five months old, and training was endless. Just when you think you've mastered one thing and settled into a groove there's a sudden plot twist and you're back to normal. One of the most amazing discoveries happened very early, just a few days after Max. She had a terrible nasal congestion, which made it difficult for her to eat for the first week and putting her to sleep was almost impossible. She screamed her head, especially at night, usually when things get worse. As the new parents on the second night we were so panicked affected we rushed her to the emergency room. I remember looking at sorting nurses' face as if to say: We have another overreaction of a new mother here thinking that her newborn is dying accompanied by an exaggerated roll of her eyes. Seven hours later and we were told everything was fine and that the babies just had a lot of mucus after delivery because in the womb they were surrounded by fluid. Fast forward to today, we're still going through some nasal congestion to be quite honest, and I think at the moment it's from a combination of a few things. First, we live in a condo where air circulation and dryness can be much worse than inside the house. In our entires, the winter months don't help either, as the heating inside makes our place very dry. In addition, I am convinced that it starts the teething process, which can also create some congestion in the nasal passage. After a three-month examination of Maxwell, I started using HydraSense products to help with her moderate nasal congestion, as recommended by her doctor. We like that it is a 100% natural source of sea water with more than 70 marine micronutrients. They actually #1 nasal saline brand here in Canada for children and contain no drugs, supplements or preservatives - making it #1 choice for Canadian moms. Combined with our Dyson moisturizer, which we installed in our room not far from its cradle, we saw a pretty significant difference with Max's slime levels. At home we apply Ultra Gentle Mist HydraSense twice a day during her morning wipe down and again during her bedtime routine. The nightly app is crucial because it tends to be more stuffy at night, and the last thing I want is that her sleep will be interrupted due to an overloaded nose while we sleep training her. may seem great and what you expect for an adult product, but the review tip Ultra soft and specially designed for use in babies' nostrils. To control the spray, I put it on my back and turn my head to one side and press down on the applicator for 1-2 seconds in the upper nostril. I repeat the process on the other side and generally wait about a minute or so as she sometimes sneezes everything. If not, I then use a nasal aspirator to remove any debris mucus still hampering the nasal passage. HydraSense nasal aspirator Kit is ideal for use in times when there is stubborn mucus that has hardened into your child's nose. This was at the top of my packing list when I was preparing for our trip to Barcelona in December and I even keep a bottle or two in a diaper bag in case I need to clean my nose on the go. It comes with hydraSense EasyDose vials and a nasal aspirator has a tube with a mouthpiece and a hygienic filter that allows you to gently suck any mucus as well as prohibiting it from going through the inhalation tube. Before using the aspirator, it is best to apply 1-2 drops of the EasyDose bottle to each nostril (make sure not to reuse the vial after it has been opened). Then insert the aspirator into the entrance to the nose and inhale through the mouthpiece to gently remove the mucus as needed. Once completed, I gently lift it to allow any remaining mucus to drain on its own. The last step, soak the cloth or cotton ball with hydraSense and wipe around the nose. Max is so used to this routine that I can even sometimes get a giggle out of it when we use a challenger. Photo Jess Baumung Check out hydrasense.ca more information about hydraSense products. To make sure this product is suitable for your child, always read the instructions and follow the label. If your child's symptoms persist, see your doctor. This post was created in partnership with hydraSense for monetary compensation and/or product however all opinions and opinions are my own. Photo: Lisa Marie Fletcher When my daughter was born at the end of May, our family was hit with a terrible cold. In just two weeks, my new little peanut was sneezing, snotty mess and struggling to breathe. This first cold with a new baby is always stressful - whether it's your first or fifth child. I did everything I could, including keeping her upright all the time, even at night. It helped a little bit. My friend then asked if I had ever tried a saline nasal aspirator. Honestly, I didn't mean to! With visions of these big bulb suckers and the thought of drowning my newborn by flushing her face with water, I just stubbornly continued to wipe her snotty face after sneezing and kept her upright for hours on end, all day and night. When she had recently started getting stuffy again, I decided hydraSense-small kit is all you need to help help nasal congestion for newborns and infants. At first glance, I admit I felt depressed. But I grabbed instructions to learn more before judging or giving up. I learned this product is basically a non-gross way to suck snot from your child's nose. You take a small part of the bulb, insert filter paper and attach the tubes. Then you inject a few drops of saline solution into your nose. (Tip: Follow the instructions to turn your head aside or the drops will go down your throat and choke your sweet baby. After that, you stick a soft, rubber lamp in your nostril and the opposite end of the tube into your mouth and you suck. All the snot are pulled out in the light bulb. Gross? Yes, really. But much better than all that green stuff going into your mouth! The filter and tubes keep that gross from you. The clean-up was easy. The bulbous section falls into three pieces, which means you can access every corner and crack and get all that gunk out. It's also translucent, so you can see that it's clean. This happens in a difficult case, too- to keep everything you need in one place, which is convenient in the busy home of curious children. HydraSense's nasal aspirator will be a regular part of our cold fighting routine from here. I know it will save me hours-long stress with my baby. This busy mom is impressed! Lisa Marie is a busy, at-home mom to four boys and a girl. When not teaching or chasing a child, she is usually on her computer where she spends her time helping other families at home across Canada through her website-Canadian Homeschooler. Multi-Testing Mommy is a place for Canadian families to stay up to date with everything related to children and family. Amanda, the founder, lives in GTA with two children and a husband. She has many of her favorite baking recipes and loves to help moms and dads navigate through the challenging and rewarding work of parenting, sharing many tips, tricks, fun family ideas and loads of information. Follow her on Twitter and Facebook for daily tips. It's easy to feel completely helpless when your baby is all stuffed up from the cold, but you can help relieve her congestion by using this nasal aspirator to suck out mucus clogging her nose. The starter kit comes with a nasal aspirator, five easydose vials of sterile, desalinated sea water (to soften mucus) and five disposable filters. Boogers are not under the match against you!
