Samsung has just unveiled its first original phone production design. The Samsung Galaxy A6s is a low to mid-range device with some impressive specifications at its price. This is part of Samsung's strategy to bring back some of the Chinese market. Samsung has just unveiled its first original device manufacturer (ODM) phone in China. Spotted SamMobile. Samsung Galaxy A6s was developed by Samsung and will carry the Samsung brand, but will be produced in factories owned by a Chinese company (potentially Wintech, ODM for Xiaomi phones). SamMobile reports that the Galaxy A6s starts at 1,799 yuan (\$260), placing it at the lower end of the middle-class market. However, it has some decent specs at its price including 6GB of RAM, 64GB of memory, dual rear cameras, a fingerprint sensor on the rear, a 3300mAh battery, a Snapdragon 660 processor, and a Super AMOLED Full HD' Infinity display. It also uses the current trend for gradient design and is available in four different colors. Along with the Samsung Galaxy A6s, Samsung unveiled the Samsung Galaxy A9s. However, it just appears to be a rebranded version of the Samsung Galaxy A9, which the company revealed earlier this month, for China. It's a more premium phone than the Galaxy A6s and its main selling point is that it's the first phone to get four rear cameras. Both devices are part of Samsung's strategy to bring back some of the lucrative Chinese market. Outsourcing this kind of workforce could reduce costs, while Samsung is also reportedly considering closing one of its own Chinese plants for the same purpose. Please note that Samsung has factories in China and a number of other territories where it has manufactured its phones previously. In the second quarter of 2018, Samsung's market share fell to 0.8%, according to Strategy Analytics data. Given the size of the market in China, even a slight increase here could see Samsung sell many more phones. While Samsung said the Galaxy A9 will be released in some markets from November, we don't yet know if the Galaxy A6s will be released outside China. Next up: Samsung is losing ground in the mobile industry. How can he stay on top? As part of its deal-day promotion, Amazon throws in a free Samsung Galaxy Tab tablet when you buy an unlocked Galaxy Note 9. The deal applies to 128GB and 512GB options that cost \$999.99 and \$1,049.99, respectively. The deal also applies to Midnight Black, Lavender Purple, and Ocean Blue Color Choice. There's no discount on the Galaxy Note 9, but that doesn't make the phone any less choice. Recall that the Galaxy Note 9 is equipped with a 6.4-inch AMOLED display with a resolution of 2960 x 1440, a dual rear 12-megapixel qualcomm Snapdragon 845, 6GB or 8GB of RAM, 128GB or 512GB of storage, a 4000 mAh battery and a single Android 9 Pie user interface. Pie. You may think it's the Galaxy Note 9 probably has it. The good news is that the included Galaxy Tab A looks like a decent tablet. The device sports a 10.5-inch IPS display with 1920 x 1200 resolution, four-spoke speakers, Snapdragon 450 processor, 3GB of RAM, 32GB of expandable memory, 7300mAh battery life, and Android 8.1 Oreo. As this letter, you have just over 14 hours left before the deal goes away. If you are in the market for a phone that packs in as many features as possible and you don't mind a free tablet, you can check out the bargain here below. The Galaxy Tab 4 7.0 is the smallest and cheapest of Samsung's latest trio of tablets, but it's packing the same amount of punch in terms of design and specifications. The build quality is very typical of Samsung with all the plastic designs and fake back leather that still feels like plastic. Despite this plastic design it feels very durable and durable with a very good amount of weight. Samsung also dropped down their chrome use on the Galaxy Tab 4 lining up to make the design look much more aesthetically pleasing. As the name implies, the front is a 7.0-inch display with a resolution of 1280x800. It's not super high-resolution, so the pixels are noticeable, but it's certainly far from a bad display as it's very bright with good color reproduction, easy to see outdoors, and has great viewing angles. Internally it is powered by a 1.2GHz quad-core processor, 1.5GB of RAM, and 8 gigabytes of internal storage, which will work quickly if you don't zoom in by expanding the micro SD. They have very mediocre specs and overall performance throughout the OS is passable with very little hiccups. Graphically demanding games are still in the playoffs, but it's certainly far from buttery smooth. You can by likes: Samsung Galaxy Tab 4 7.0 cases and covers. Just like the rest of the tablet camera nothing to write home about. It does pretty well with lots of light, but once you take it indoor photos become grainy especially in low light and without autofocus the camera struggles to take clear shots. The biggest highlight of this tablet is battery life. It's packing a 4000 mAh battery inside and it lasted me about 2 days under heavy use as I primarily used a tablet for games with some light web browsing and social networking. At the end of it all I ended up with just over 7 hours of screen at a time, which is quite impressive, so I have no doubt that this tablet can last from 3 4 days with medium use. The Galaxy Tab 4 7.0 comes with Android 4.4.2 KitKat out of the box with Samsung's TouchWiz interface. TouchWiz is still TouchWiz, but the version on the Galaxy Tab 4 is lining up much more Down. Many features found on higher-end Samsung offerings like my magazine and air gestures are not included, but increasingly useful features such as multiwindow, palm napkins, and smart stay intact. The Galaxy Tab 4 7.0 is now available in black and white models for 199.99. It's WiFi just now, but 3G/LTE options will be coming to carriers later this year. The price is a bit steep, especially when you can get the Nexus 7 for 30 dollars more and get the best kick for your dollar when it comes to the specifications of making the Galaxy Tab 4 7.0 a really tough sell if you need that micro SD extension or just want Samsung made tablets. It's small, portable, and cheaper than the Samsung PRO line, but it's not without its flaws. With other competitive options for similar prices you might be better off looking elsewhere. If you think you don't have much more to say about Samsung's Galaxy tablet line, you're probably right. Since the launch of Galaxy Tab 10.1 last summer, it has been dissected and discussed a million times. We love the screen, we love thinness and we almost love TouchWiz. And those feelings translate to younger brother in the Galaxy Tab line, 8.9. So instead of bending my ear about things we've said, let me take a different view. We know what the Galaxy line has to offer, but what does the 8.9-inch form factor do to propel the line even further? And most importantly, what can consumers get from more compact sizes that they just can't with 10.1? The screen is huge, the performance is outstanding, and the 8.9-inch footprint is the standard all tablets have to live up to. I wish Samsung could squeeze the microSD slot there. In addition, the \$469 base price is a little high. This is the Galaxy Tab we've all been waiting for. If you can digest the price, and don't mind the limited storage space, you can't find the more refined, powerful and beautiful Android tablets on the market today. Just as 10.1 impressed me with its sturdy-as-nails builds, 8.9 beautiful device made. This hair is thinner than 10.1; 8.6 millimeters thick, it is technically the thinnest tablet on the market today. This will change over time, dramatically we are sure, but if you are in extremes, 8.9 is as extreme as you get today. It's also noticeably thinner than 10.1; I don't have a scale around to weigh two devices, but the 8.9 smaller track indeed includes its weight. And that less footprint: I'm in love. As someone who forked over \$500 for my Galaxy Tab 10.1, I'm kicking myself right now. The difference of 1.4 inches, while minuscule on paper, makes a world of difference. If you handled 10.1 and thought it was just too big, you'll feel at home with 8.9. You'll be able to keep it in one Without fatigue, and in both hands, you will be able to enter with your thumbs. Samsung clearly put a lot of thought into these different size points and I, for one, am grateful. Note, heavy readers: the 8.9-inch display is perfect for electronic reading. You won't be disappointed. Although 10.1 and 8.9 have the same screen resolution (1200 x 800), the smaller screen reigns, as its size lends itself to a significant impact in pixel density. And don't think you won't notice it. Compared side by side, the 8.9 looks noticeably brighter, sharper and more colorful than its older brother. This is not to say that 10.1 doesn't have a gorgeous display, but the 8.9 is definitely more beautiful. And it really says something. Size differences aside, the only other discrepancy you'll notice is hardware-wise is the placement of the speaker. At 8.9, the speakers are located on the bottom of the tablet, next to the charging port. Compared to the 10.1 speaker placing on the left and right side, I didn't notice any difference in sound quality. Both produce loud, clear volume, although remember that they are tablet speakers, and sounds as such. You won't be replacing stereo speakers anytime soon. The Galaxy Tab 8.9 software ships with Android 3.1 out of the box, running under Samsung TouchWiz optimized for the Galaxy tablet lineup. I really grew up loving TouchWiz on the Galaxy Tabs as I think it's a huge improvement over the Honeycomb stock. Aside from aesthetic improvements, things seem much more user-friendly. A number of quick apps at the bottom of the screen work flawlessly, although I wish they were customizable. TouchWiz does room on Honeycomb Widgets, and that's good: they're resizable, prettier, and easier to set up. All of Samsung's custom apps are here, too, including Media Hub, Social Hub, and Samsung's own app store. I really love Media Hub: its competitive price, and the content is nothing to sniff at. I also love the opportunity to purchase movies or TV shows and have them available in all my Samsung devices. My interest in Social Hub is less enthusiastic, although it may be chalked up to my general disdain for everything that aggregates my social networks. Nothing can be said about TouchWiz, which has not yet been covered ad nauseam: if you're still curious and haven't had a chance to try it in person, check out our detailed touchWiz guides here. Performance is OK, that's where things get interesting. Remember when I said that this review would be more about how the Galaxy Tab 8.9 advances the Galaxy line where 10.1 stopped? Well, that's what I'm talking about. 8.9 has the same dual-core Tegra 2 processor, and the same 1GB of RAM as its older brother, so you'd think the performance created is equal. You're wrong. Performance on horse racing and the boundaries are better than 10.1 and I have no idea why. I know I know. The specifications are the same, the software is the same, Android is the same. Hell, even the quadrant makes the same bill. What does it give? I don't have an answer for you, except that side-by-side performance between the two devices doesn't lie. 8.9 is noticeably more flexible than 10.1: stutters, hiccups, and delays that make 10.1 times a challenge in using nowhere found at 8.9. apps open instantly, widgets load without hesitation, and multitasking really blazes. Everything is fast and I mean very quickly. And don't think you'll have to give up speed for the battery. The 6100 mAh battery lasts a long time, so long actually that during my time with 8.9, I only charged it a few times. When you stay on standby, on WiFi, you easily get a day and a half of 8.9. If you turn off Wi-Fi on standby or turn off your device between use (it loads quickly, so it's not too inconvenient), you'll get over four to five days on a single charge. This thing never dies. Let me make it clear: I find no joy in bragging about how fast 8.9 is. In fact, it hurts me that I forked over \$500 before I saw what Samsung is really capable of. Hopefully the software and hardware optimization that make the 8.9 fly can be added to the 10.1 in the update. I keep my fingers crossed. We know that you can make a tablet without errors, Samsung. Now make sure all your devices reach the bar you set. The cameras are the same old, the same old ones. The front and rear cameras are identical to those at 10.1, and have similar results. The 2-megapixel front-facer is more than enough for a video call; in fact, testing video chat on Google Talk produced very good results. The rear camera has 3 megapixels and can shoot video at 720p. It's just fine in a pinch, but you'll find better on most smartphones on the market today. And to avoid the risk of looking really weird, we advise you to refrain from taking videos with any pills in public. Summing up the Galaxy Tab 8.9 is a very, very nice device and I think it's safe to say that this is the best Android tablet on the market today. Take everything you liked about the Galaxy Tab 10.1, like screen, thinness, and weight, and improve them enough to push the Galaxy Line tablet to the level to be reckoned with. 8.9 super light, it's super thin, and it's finally the device I've been waiting for: big enough to enjoy the content, and small enough to hold comfortably in one hand. It's really a portable tablet. And beauty 8.9 is not just deep skin. The Tegra 2 processor was configured really push the 8.9 together at breakneck speeds. I like how fluid the user interface is, and how powerful the performance feels. This is how 10.1 must perform, and hopefully will perform A few updates. I didn't love everything. I wish Samsung could squeeze the microSD card slot there somewhere, and HDMI-out would also be mean. But if these are the necessary sacrifices for a remarkably thin and light body, then these are the sacrifices I'm willing to make. I also think Honeycomb has room for improvement. There are certain tasks that should not take almost as many steps as they should, and mistakes, while a few and far between are still present. For example, the market needs some customization. Quick. There are plenty of mistakes. But it's a problem with Android 3.1, not with the Galaxy Tab 8.9. If you are in the market for a Honeycomb tablet, you have met your match. Size can't beat, the screen is mind-blowingly gorgeous, and the performance is top notch. The Galaxy Tab 8.9 is promoting the Galaxy tablet line, where 10.1 is somewhat disappointing. This is a tablet that Samsung should be proud of. The Samsung Galaxy Tab is currently available in two sizes: a 16GB model priced at \$469, and a 32GB model priced at \$569.
