The first step in creating a paver patio is to remove a few inches of dirt in preparation for laying the base material. The secret to success in any reconstruction project comes down to one thing: tools. If you have the know-how and the right tools to work with, you can accomplish virtually everything, even those projects that you can think of, from your league. As in most cases, the first few steps will set the bar. With painting, it's all about preparatory work. For the drywall finish, it is a matter of correct progression of the layering of the joint compound. But with projects like adding a patio (whether you plan to fill a stove or use an outdoor paver) it's all about excavating. This is where the right tools will make or break you. Watch As a class lot and digs for the driveway or paver patio for more information about the excavation. Did you know that rock, shoes and a hammer all have in common? Each of them can drive a nail; But if you want to manage these nails faster and with less effort, you are going to use a hammer. For great work, like adding a patio, you need to do the same. While you could dig a shovel even on the ground, you'd better use heavy equipment as a skid to steer. You will need to move a fair amount of dirt to start with the right base for the foundation. This is especially true if you are planning on laying pavers. In most cases, you need to unearth at least four inches to spread the correct base like crushed limestone. See Tips for Laying Paver Patio for more information. As I mentioned, my recommendation is to ditch the shovel and rent a skid to send. The skid booster is a heavy part of the technique that belongs to the family of tractors and several brands provide these including Bobcat, Thoreau, Boxer and Terex. What surprises most people is that almost everyone can work skidding to steer. There are no special licenses to earn and you don't have to be a contractor. Just rent the right things and you will have the convenience of a professional class of equipment at any time. Digging a trail for a large patio is much easier if you have the right equipment. You can look for rental companies in your city to find a skid to send, but my professional advice is to visit the compact Power Equipment Rental website or call them at 888-COMPACT. They are located in more than 1,000 Home Depot stores in the U.S. and Canada and offer convenient solutions for your hardware needs. One of the main reasons why we always choose Compact Power is that they offer VIP delivery on the spot. Not only will the equipment be delivered to your website, but The technician will also drop him off and walk you through the skid work to steer step by step. In addition, they will not leave until you are comfortable working with the equipment. Renting a skid to send can make the job go much smoother. Using a skid to send to work as it saves so many effort and - let's face it - sweat equity that could have been better spent in the finer details of building a patio. Not only does the skid send to dig up the dirt for you, it also easily and just moves it. You can also use a skid bucket to send properly to spread dirt on the class you want. The equipment is also very handy for moving materials, so keeping the skid to send to the end of the project will certainly pay off. Remember that special base of shredded limestone? Nothing will move and distribute it faster than skid to steer. By the way, if you have a smaller yard and you're concerned about a really big piece of appliances in place, you can rent a mini skid to send instead. In any case, the heavy equipment from Compact Power adds a ton of convenience to your workplace - it will reduce time, lighten your workload and still make sure you have a stunning finished product. When you have a house built in 1920, you have lead - it's in the solder on the old pipes, and in the paint on the old walls. When you have children, you worry about lead exposure can affect their learning, their breathing, their health. We do everything in our companies, filtering the water that comes out of these old pipes, and keeping the pristine layers of today's paint without lead over old things. But when you start tearing down walls, you change the equation. Thus, the first step in building our new kitchen will be testing for lead in the old one. The U.S. Environmental Protection Agency (EPA) is demanding a test, even though our home was almost guaranteed to fail it. And it was, of course. The interior and exterior walls are all lead-based paint on them, under several decades worth of safer paint. That meant hiring an EPA-certified lead-safe demolition company, not a bunch of guys with sledgehammers. (Ka-Ching! Before we even started, we had the first \$5,000 upcharge in our contract.) Every inch of the old extension, every inch of the old floor and walls and ceiling, every body window, and every inch of the exterior of the tiles that could be broken during construction had to be hand-removed by the guys in Hazmat costumes, then wrapped in thick plastic sheets and placed on a go-kart truck. All this happened behind thicker sheets of plastic that completely sealed the kitchen from the rest of the house, with an air-sucking reverse pressure machine running at full speed to keep any lead dust from leaking out of the workspace. It was extremely dramatic, to say the least. But for the drama, nothing to beat the day the digger arrived. This little dotted line on the plan, which showed a new foundation two feet from the old one, didn't prepare us for what the excavation would mean. Our five-year-old Bob the Builder fan excited though: Mom, look! Scoop is in our backyard! About 24 feet of our cedar picket fence was to come down to Scoop his access, and it turns out that he is a heavy guy who leaves deep marks. Even though the land was still frozen, I could tell that part of our lawn and garden was in a miserable spring. The hole needed for the new foundation was much bigger and deeper than I expected. We didn't get a full basement under the extension, just a crawl space, but the new foundation walls came down as deep as the basement. (Actually, the foundation guy offered us a full basement for \$3,000 upcharge, but we refused- we didn't need any more basement space, didn't plan on it, and it was too early in the job to add more costs.) It took longer, too, as Scoop was in our backyard for the better part of three weeks. It didn't help that it was March - a rainy, dirty March, too many days that were just too wet to run the foundation. Plans showed that space scanning needed a hotspot - there would be plumbing, electrical and insulation work there - and (surprise!) there wasn't enough room for that on the outside of the house. It had to be cut through the existing foundation wall connecting the basement to the bypass space. I had to admit that it was better in terms of security - whoever goes into the scanning space must be someone I know and let in the house!, but it was a horrible, messy development. You didn't live until you saw the dust kicking up the jackhammer going through a two foot thick foundation wall. We covered everything in the basement as much as we could with plastic, but we knew that at that point we lost control of things on the lower level. Before the work started, we would carefully box and number the contents of the kitchen to store downstairs for the duration. Keith then discovered that the electrical line that powered our garage door opener ran right through where the new foundation would go, so before the excavation began we would have an electrician to move it. (Look what I mean about Kate? Of course, this line ran out of the house from the basement, right above the wall, where we folded all the boxes, so the electrician had to move them all. (Now they were all shoved randomly in the middle of the basement-out numerical order!) And now two other storage shelves have been moved for a jackhammer, their previously tidy contents are also in complete disarray. Not only was the basement now in a state of chaos, everything was covered with a thick layer of dust. It's going to take us years to find everything again. But we started and we were on our way! Next: Hidden mines, hidden works of artin the time you have reconstructed your kitchen? If so, we'd like to see before and after for the Kitchen Makeup Gallery, which we plan to create on Go to Facebook and upload your photos right now. But don't take these machines for one job. With proper encouragement (and operator) they can achieve much more from absurdity to absurdity, but impressive. That's it! Advertising - Continue reading below this hungry digger makes a hot dog a really impressive feat right down to this part with ketchup. This is not the case with a hot dog! Even excavators can be wrong. Here is an excavator climbing the trailer Sometimes you need to climb on something and there are just no ramps to be had. What should a poor excavator do? Time that hand/tail to use and get clicking. Check out this (not so) little excavator who could (make it up the stairs!) This water excavator is a children's giant slab of concrete as boat excavators are commonly known as ground creatures, but sometimes a wild excavator can be found venturing into the water. See here as a river excavator paddles its owner downstream. This digger and his friends play Jenga on the night of the game Yes, most excavators spend a lot of time on construction sites and the like, but they are not all workaholics. Sometimes the excavator just needs a chance to relax. Watch here as the excavator plays the game Absurd Big Jenga with some of his closest mechanical friends. Here is an excavator trying a free climb While most excavators are content to stay on the ground and play in the mud, the occasional eccentric car will take to the trees. Watch here as the excavator climbs the tower, no doubt to the sun itself on the canopy of the urban jungle! This valiant excavator is putting out a fire Although sometimes easily spooked, excavators are also known for their bravery. See here how the brave hero of the excavator valiently confronts his fears and releases fire. Very nice and neighborly excavator helps wash the machine There's nothing loyal and well trained excavator loves more than helping with business Home. Here's a helpful guy doing his part to help wash (and destroy) the family car. Good boy! The cunning excavator skillfully threads needle excavators burnade and strong, in that there is no doubt. But that doesn't mean that Simple beasts ofafish! Many excavators pride themselves on agility, and there are some that can probably thread needles better than you can. This sports excavator loves to help water skiers When they don't paddle their own concrete boats down the river, many excavators are overjoyed with the prospect of helping others enjoy the thrill of extreme water sports. Ask your friendly neighborhood digger for a favor this summer and it could be you! An acute-eyed excavator picks up a spare excavator change thrifty, as if I need to tell you that. This excavator-cracking works already on weekends. When all is said and done, the excavators are the same as you and I. And after a long day of work, they just want to sit down and have a beer or five. Who can blame them for this?
