important for transferring information from the local subnet to other subnets, and vice versa. So, in order to connect to the Internet and browse websites, you need to set up the gateway properly. This is the default exists as a combination of numbers and decimal signs. However, this local IP address is called gateway by default on Windows PC, while on MAC and iOS it is called Router. The default gateway is also notified of a local IP address. How to find a default router gateway or IP address As to find the default router gateway or IP addresses that we've discussed above, in order to surf the Internet on your device, you need to set up an Internet-connected router. You need a default IP address or router IP address to set up the provider's gateway and DNS. This section will explain how to detect the default gateway or router IP address on Android, Windows and Mac OS. How do I find the default gateway IP address on Android? Click on Wi-Fi. Here you will see the name of the Wi-Fi network your Android is being connected to. This will open the default router display window Gateway. This is a universal method to find the default gateway on phones and Android devices. How do I find the default gateway IP address on my Mac? From your iOS device, open the Settings. Tap Wi-Fi. Tap (i) button next to your network connection. Find your IP gateway address listed next to Router. How to find the default gateway IP address in Windows. There are two ways to find the default gateway on your Windows computer. We'll discuss both methods to find the default gateway on Windows PC. Use the Win+R Press control panel to open the Run dialogue window. Enter Control and kick enter. This will open the control panel. Go to the Network and Internet Division and Exchange Center. Click on the currently connected network. This will open the Wi-Fi status window. This will open a new dialogue. Find the default gateway listed as IPv4. Using Command Prompt. Open Run Dialogue box by clicking Win+R. Type cmd and click enter to open Command Window. Type ipconfig/all and click enter. Find the default gateway in the list. Final words: You can use this default router gateway to log into the router configuration and the customization window. But it's a good idea to use your router configuration carefully. The wrong configuration can disable your Internet connection, and you may find an error when you connect to the Internet. You can also use these window installations to reset the Internet settings if Android is connected to Wi-Fi, but no internet works on your device. Read also: I often tinker with network settings on my desktop and phone, and I can confirm the IP address is the most important piece of information you need for network configuration. There are different types of IP addresses - router, local and public - and each one serves a different purpose. If you need to set up a network on your Android phone, you need to know how to find an IP address on In today's post, I'll tell you how to find a router, local and public IP address on Android and what every type of IP IP Used for. Note: Before following the instructions below, make sure you are connected to the network (WiFi or mobile network). How to find the router's IP address on the Android Router IP address (as well as the gateway address) is used to access the router settings interface to customize your router settings. You just need to enter this address in the address rack of the browser and the router settings will open (you may need a password). Here's how to find your router's IP address on Android: Go to Settings and click on Wi-Fi settings. Click and hold the connected network here, and then select Network Settings Management. Now check the box next to the Show Advanced Options and select Static in the IP Settings section you will find the router's IP address in the Gate section. Important note: After finding the router's IP address, make sure you press the Undo instead button. You probably don't want to have an IP setting that will be installed on Static. How to find a local IP address on Android Local IP address is used to identify different devices in the same network. The router automatically assigns a local IP address to each device that connects to it. This address can be used to identify each device on the network and connect them. For example, if you want to connect an app on your Android phone computer, you need a local IP address for at least one of the devices. Here's how to find a local IP address on your Android phone: Go to Settings and click on the device option at the bottom. Click on the Status button here and you'll find the local IP address listed in the IP address section. There may be both IPv4 and IPv6 addresses listed. The one that looks like 192.168.x.x is the IPv4 address you should use this one. Note: This method may not work on older Android phones. If so, follow the above instructions I provided to find the router's IP address and you will find a local IP address directly above the Gateway address. How to find a public IP address on Android Public IP address (also as a global IP address) is disclosed throughout the network to identify your device and send back information. For example, when you submit a request to a web page, a public IP address is sent along with a request so that the web page knows where it should send back the information. Here's how Google explains it. You should probably know a public IP address if you have remote access to the device from another location/network. Either way maybe here's how to find your public IP address on Android: With your Android phone, open your browser and enter that my IP in Google search. Google will automatically show your public IP address at the top. In addition, you can also visit to find your Android ip address. Tip: If you often need to check check Public IP address (for example, if you use a VPN to access blocked content), then a special app like That my IP address will be useful. Ending thoughts like the router and local IP address can be found right inside the phone's settings, but for a public IP address, you'll have to get some help from third-party services. In addition, the use of a local and public IP address can be a bit confusing. Just remember that a local IP address is only needed when all connected machines are on the same router. For everything else, use a public IP address. Let us know if you liked the post. That's the only way we can improve. Improve. how to find the default gateway ip address in android
