Also known as data search, find materials and properties of information from technical links. By far the most common and energy-intensive units in almost all industrial sectors, industrial drying continues to attract the interest of scientists, researchers and engineers. The Industrial Drying Handbook, the fourth edition not only provides a comprehensive treatment of the current state of the art, but also serves as an advisory guide for the rationalization of industrial drying operations. New to the fourth edition: Computing liquid dynamic simulation of solar, encroaching, and pulsed combustion drying of fruits, vegetables, sugar, biomass and coal physical and chemical aspects of drying sludge life cycle assessment of dry coating systems commonly found dryers, as well as innovative dryers with future potential, Guide to industrial drying, the fourth edition not only details of recent developments in the area, but also explains how the improvements in the design can improve the design. The constant updating of content and authors has preserved the quality of ™ and attitude to the constant development of drying. Professor Bhesh Bhandari, University of NSW, Brisbane, Australia The Fourth edition of this guide contains updates to the previous edition and includes 12 new chapters that greatly enhance the value of publication. It should be emphasized that the authors of individual chapters are specialists from all continents of our globe, which makes the entire handbook useful in each region with different requirements and technological capabilities, especially in areas where the development of different fields of research and applications is at an early stage. The fourth edition is an example of a comprehensive set of applied research and engineering knowledge that enable and facilitate the implementation of innovative plans and progress in drying technologies. Twelve new chapters have been added, which include the drying of pulse combustion, the physical and chemical aspects of sludge drying, the supercritical drying of liquid and the evaluation of drying systems on the life cycle. This compilation is very well edited and very consistent with regard to content, item, tabular presentation of data, graphs and diagrams, despite the fact that it is a large number of experts from all over the world. I am convinced that this book can be useful for students, graduate students, researchers and practitioners involved in drying technology. Janusz Adamec, Faculty of Process and Environmental Engineering, Lodz University of Technology, Poland (ret.) Arun S. Mujumdar is an associate professor at McGill University, Montreal, and Western University, London, Canada. He holds a Bachelor's and PhD from the Chemical Technology Institute in Mumbai, India, as well as a PhD and PhD from McGill University. He is the founder/chairman of the International Drying Symposium programme. His work has been featured in more than 500 referee publications. He is the author of two books, has edited more than 60 books, and is currently the editor-in-chief of the International Journal of Drying Technology. Winner of numerous international awards, including Dr. Onoris Kausa from the Technical University of Lodz, Poland and the University of Lyon, France. In 2014, he received the prestigious National Prize for International Cooperation in Science and Technology from the Chinese government.
