Once you start the program successfully, it shows its main window on the screen, divided basically into three parts. The left side is File Explorer, which contains folders related to program components. These are files related to the current project, plug-ins, effects, projects, instrumental samples, vocal samples, recorded tracks, demo projects, and so on. In the central part they contain a tool pattern, while the right side is a real editing of the console. It contains tracks to drag selected sound samples. The first thing you need to do is select samples to use in your track, determining the rhythm of each pattern through the central section of the program. You can use a maximum of 16 strokes by coloring them with the right click. So you can get both a simple and sophisticated pace. For example, you can create syncopated rhythms with these beats. You can set the planning tool and the volume by turning the handles on the side. If necessary, you can listen to the resulting template by first installing the program in PAT mode left) and then pressing the Play button. Once you've identified samples, you can add them to the song using console editing. All you have to do is click on the piano-shaped icon (for bass), audio wave (for instruments), or sequences (for vocal tracks). Identify the sample you're interested in and drag it to the right track with your mouse. You will zoom in, exit, move or edit the newly added watch depending on your needs. Or you can repeat this step with any other samples you want to add to your song. In addition to the above features, you can add additional templates by selecting them from those included in the program. You can find these effects in folders such as channel presets, Pulses, Miscs, packages, and so on. They are in fileimmy. Again, using the same procedure, you can insert effects and plugins included in the program. Once you add templates to the console, you can identify the related details through the editing screen that appears on the screen by clicking on the sample name. To insert an effect or plugin, select it from a console template and use a pencil tool or tool brush living at the top of the editing console. You can play the resulting song by first clicking the Songs button in the top left and the Play button next to it. You can change the BPM with the box next to the recording button. When you're done, you have the option to keep the newly created project in FLP format. Means that if you need information about a key switch or a box that you don't understand using it, you can move the mouse cursor above it to get a brief description. They display it in a panel at the top left of the program screen. As we mentioned at the beginning, Music Studio is a valid instrument also for creating mixes between multiple songs.
