The theory of an industrial organization is the first basic text for the treatment of a new industrial organization at the level of advanced students and graduates. Strictly analytical and filled with exercises coded to indicate the level of complexity, it provides a single and modern field processing with accessible models that are simplified to highlight reliable economic ideas, working on an intuitive level. To help students at different levels, each chapter is divided into a basic text and an additional section containing more advanced materials. Each chapter opens with elementary models and is based on this basis to incorporate current research into agreed synthesis. Tyrol begins with a background discussion of the firm's theory. In part, I am developing the modern theory of monopoly, addressing the prices of one product and multiproduct, static and inter-time price discrimination, quality choice, reputation and vertical limitations. In the second part, Tyrol is engaged in strategic interaction between firms, starting with a new solution to the problem of interdependent pricing Bertrand-Cournot. It explores how capacity constraints, repeated interaction, product positioning, advertising and asymmetrical information influence competition or tacit collusion. He then develops topics related to long-term competition, including barriers to entry, competition, output, and research and development. In conclusion, he receives a user guide to game theory and the review section. I think that this book will fill a huge void in the market of textbooks for advanced courses of bachelor's and master's courses in industrial organization and applied microeconomics. The power of Tyrol's work is his masterful synthesis of analytical development and intuitive discussion. Consequently, it makes it clear to the reader some very advanced research. This synthesis will prove invaluable to graduate students who are looking for their niche research. John.
