SHOP FOR PARTS TalkBack announces this because it detects your control as something you can interact with. EX: button. Given your markup, particularly your accessibilityHint, which I assume is the property of Appcelerator, it would seem that your control is really a button of some sort. Why would you want to disable this useful ad? My answer will be to remove your hint and let the ANDROID OS deal with this button as it wants. Your hint is no more useful than a TalkBack hint, and it's best to let auxiliary technologies share roles and training information whenever possible. The only way to get TalkBack is not to announce it is to make your controls not interactive. If TalkBack finds that the control can interact with (clicked) it will announce these instructions, there is nothing you can and shouldn't do about it. I know it's way late to the game, but posting an answer here for anyone who might happen to come across this post. The rest are right... we don't have to put a widget type or how to interact with the widget in the description of the content. However, all is not lost. Starting with API 21, there's a way to customize the text interaction through AccessibilityNodeInfo. There are two ways to use this class: AccessibilityNodeInfo has a getActionList method. You can add customized text that you read out TalkBack by adding a new item to this list: info.getActionList ().add (new AccessibilityNodeInfo.AccessibilityAction (AccessibilityAction.ACTION_CLICK, choose); the aforementioned code must change the Double Tap to activate on Double to choose. I say must because I just write that code from memory ... I haven't checked what it is. right, but it must be something in that direction. There are two ways to use this class, and the one you choose will depend on your situation. Method 1: Subclass of your view: If you create a subclass view that you use (in the case of AN OP it will be a sub-class button), then you can override the onInitializeAccesibilityNodeInfo method and put the code there. Documentation: (android.view.accessibility.AccessibilityNodeInfo) Method 2: Creating delegate availability view It can be a little tricky and involved, but it offers a ton of flexibility because you don't have to subclassify the types with which you work. Each species has a method that allows you to set the delegate availability that acts like a person in the middle, and you can customize things for availability purposes before the information goes to TalkBack. Documentation: (android.view.View.AccessibilityDelegate) So basically you're creating a subclass View.AccessibilityDelegate and override it onInitializeAccessibilityNodeInfo () method with the code I posted above. Documentation: (android.view.View,%20android.view.accessibility.AccessibilityNodeInfo) Last but not least... I came across a way to stop the Double Tap to activate the text from Being Talkingback. This should only be used when it really makes sense to remove it. I repeat... usually that's not what you want to do. I recently came across an event where it made sense. I used TabLayout and I noticed that Talkback would always read Double Tap to choose when the focus was on the chosen tab (yes, I used the method described above to change the text). Ok... We don't want to tell the user to select a tab that has already been selected, especially when the action leads to a non-op. So, I used this little trick to get rid of this, but only for the tab currently selected. I left the unselected tabs alone, so Talkback will still give them a text interaction. In your onInitializeAccessibilityNodeInfo method, you can put the following code to remove this text: info.addAction (AccessibilityNodeInfo.ACTION_FOCUS); Again, I write this code from memory, so I don't know if it's 100% out there, but it gives you the essence of what to do.
