Sabrina Ashley Many programs offer an extra layer of security. These programs require a password to run or delete the program. For financial software and other programs that contain sensitive and sensitive information, password protection provides security. Removing password-protected programs takes only a few steps. Click on the Start menu. Click the Program button and then click on the Program and Features button for Vista and Windows 7. Search the list for the password-protected program you want to delete. Click on it. Click delete for Vista and Windows 7. Enter the program password on demand. Hit Enter Key. Confirm the program's removal. This instructable will show you how to get around a password-protected file. Suppose your computer is not downloaded and you have no way to access important files. Don't worry there are several ways to access the files. I had an old laptop emachines running the XP Home Edition and it will be downloading on the windows password but won't go any further. I ordered an external hard drive case with a usb cable from newegg.com. It gave me back \$15.00. I removed the hard drive from my computer emoji and put it in the hard drive case. I then plugged in an old emachines hard drive using a usb cable on my HP computer. I let the computer open old hard drive files and there they were. The only things I was interested in saving were my documents, photos and a few files that I had stored on my desk. I then clicked on the file and received an error message (Menu is not available Access denied). No need to worry I figured out how to access these files. Follow the instructions. If you receive an error message when you click on the file, click OKRight to click on the file you want to access. Select PropertiesSelect Security (you'll get a security message) Select the owner of OKSelect Go To: Change the owner and select ADMINISTRATER (or file you want to change the owner) Select the next BOX (Replace the owner and sub container and objects) Select ApplyThe next security message will appear. ( All permissions will be replaced if you click yes) Click yes Select OKSelect OK Now go to the file you want to access and it should open. You can also download a free Hiren's Boot CD. This is the best CD I've ever owned for cracking passwords and repairing computers. I'll do it instructable when I get the chance. If you have important files on your Mac or PC that you want to keep secret, there are several security measures that you can use to protect your information. It's common to lock your computer when you're not using it, so the password to bypass the entry screen. You can also protect folder passwords, which is useful when using a shared laptop or desktop. Because most versions Windows can't protect files with a password, you need a third-party app such as 7-Sip. 7-Sip is a free open source file archive tool that protects folders with a password. Follow these steps to protect folders with a password with 7-sip: Download 7-sip and install it on your computer. Find the folder you want to protect with your password, tap the right button, and then select the 7-zgt; add to the archive. In the Encryption section, enter your password and then select OK. You can change other attributes and settings for a compressed folder. These settings include the archive format (the default is 7 euros), the place where the archive is stored, and the compression level (install it in the Store so you don't use compression). Check your password-protected folder by opening it in Windows Explorer. You should see the password hint. In the future, anyone who tries to view or retrieve files in the archive should enter a password. The original folder is still on the computer and can be accessed without a password. Only a newly created archive file is password-protected. Remove the original folder in Windows Explorer. If you don't want to use a third-party version of the app, an alternative may be available depending on which version of Windows you're using. If you have Windows 10 Professional Edition, for example, there is an integrated encryption feature called the Encrypted File System (EFS) that can add some layer of security to your private folders. Take the following steps to determine if you have access to this feature: Click the Right button on the folder you want to encrypt and select Properties. Choose an extended button. See encrypt Content Compression attributes or encryption to ensure data verification is secure. If it's available, select a checkbox. Choose OK and select the settings you want on demand. Your folder and its contents are encrypted and only available to your account. Someone logged into your Windows account can access this folder without a password, so it's not an ideal solution. Mac users can protect individual folders without third-party software using the Disk Utility operating system app. Here's how to do it: Open Disk Utility. The easiest way is through Finder, through the apps of the zgt; utilities. Go to file the image of the folder. The keyboard label is Command-Shift-N. Find and select the folder you want to protect with a password, and then select Select. Change the type of encryption to 128-bit AES encryption (recommended) or 256-bit AES encryption (more secure, but slower). Enter the password in both boxes and then select Select. Select the image format drop-off menu, and then select reading/recording. You can give the DMG file a custom name and choose a different to save it. Choose Save. Wait until a password-protected folder is created. It's finished when you see a successful message operation. Choose Ready to Hint. You can also get out of disk Utility. Access to a newly protected folder creates a disk image containing files as soon as you successfully enter a password, usually next to a secure archive. When you get access to the contents of the folder, remove that image of the disk by dragging it into the trash. If not, you leave its contents open without password protection. Now that you know how to protect folders and files, it's important to know the difference between encryption and password protection. When a folder or file set is password-protected, the data does not change or be rebuilt. This level of protection requires a password to gain access to the files. When the same files are encrypted, the related data is scrambled in such a way that the prying eyes will have an extremely difficult time deciphering. To arrange your data back into an unencrypted form, you enter a password or password. The difference is that if someone gets access to these files encrypted and they don't know the encryption key or password, the content is unreadable and useless. Open the document and then click the file to zgt; protect the documents with a password to get started. You can change your password or delete it completely at any time, but you'll need access to the file. This article explains how to unlock Word documents and the best way to remove passwords from Word documents when you forget that your secret code. The instructions in this article apply to Microsoft Word for Microsoft 365, Word 2019, Word 2016 and Word 2013. Protecting a Microsoft Word document with a password is easy because the program itself contains its own free password function. Here's how to use it to block your document. Open the Word document you want to protect. You can also add a password to the new Word file as soon as you create it if you want. Choose a file. Choose the informational protection of the documents. Click Encryption with password. Enter the password in the box and select OK. Your password will be hidden from you as you enter it so be very careful with what you enter. Enter the same password you just created a second time. This is done in order to make sure that you know the password that you are setting and that you have not made a spelling mistake for the first time. Choose OK. If you haven't already, write down the file's name and password in a separate file that backs up the cloud in case you forget it later. Microsoft OneNote or Evernote is perfect for these situations. Save the file as usual. The Microsoft Word document now requires you to open a password. If you're sending a blocked Word document to a friend or colleague, you don't have to worry about how to teach them how to manage password-protected files because Word automatically asks for a password as soon as someone tries it. Similarly, if someone sends you a Word document with a password, the program will tell you to enter the password immediately. Even if you're the one who added the password to the Word document, the file still asks for a password every time you open it. You can change your password or delete it completely at any time, but you need access to the file to do so. You need a current password to change or delete it. Here's what you do to edit the password of the Microsoft Word document. Open the Word document as usual and click the File. Click The Information to protect the document. Click Encryption with password. Remove hidden characters in the text box and click OK to remove the password from the Word document. Enter a new password in the box and click OK to change the Word doc password. If you forget the password for your Word document and you can't find your record of it that you wrote when you created it, there's still a way to access the contents of the file. To unlock Word documents protected by a password, you need to use a brute-force password recovery program. Many of these programs contain malware and require payment for use, and many of them no longer work because Microsoft has increased its security. A good free option is the Password Find website, which can unlock secure files directly on the site and does not require the installation of any suspicious software. The unlocking process is also free and easy to use. Open your preferred web browser and go to this page on the Password Find website. Click View and select the password-protected Word document you want to access. Click the next step. Click on the bullet point nearby to remove the password and select the next step. This option gives you access to the contents of the Word file and is free. The Find password requires payment and tells you the password. After a few minutes, the process is complete and you are given the opportunity to download a document without a password or view it online as Google Doc. You can also click Delete to remove the file from the site's servers. Servers.
