Line Trucks 1 image of Aaron Kor from Fotolia.com preventive maintenance checklist just like the pre-travel inspection. The Department of Transportation requires commercial truck drivers to pre-report checks in advance and enter it into their driving history. Because the preventive care checklist is so familiar, it's easy to combine two functions before each trip. This will ensure your tractor-trailer stays on the highway. Checking under the hood before each trip is a must when it comes to preventative maintenance. This will allow you to notice any possible problems early and this may prevent costly repairs in the future. Items to check include fluid steering, motor oil, windshield wiper liquid and fluid level. Carefully check all the hoses, looking for signs of wear, cracks or leaks. Physically check the voltage on all the straps and look for any signs of cracking or excessive wear. Examine the entire engine for leaks, including ground under the engine for any new liquid spots. Examination of the exterior of the tractor will not only help to prevent expensive repairs, but can also prevent the receipt of citation from the Department of Transportation (DOT). DOT inspects the appearance of the tractor on the cargo scales and at inspection facilities. Turn on the lights, running lights, turn signals and emergency flashing lights, and make sure the lenses are not cracked or missing. Starting from the driver's side, look at the body of the tractor. Make sure the mirrors are safe and nothing hangs from the body. Make sure all side lights and turn lights work properly. View the front and rear tires and wheels, including bolts for the haul. Look for any signs of cracks or abnormal wear on each wheel and tire. View the springs, drive line and universal joints. If parked on a level surface, back and see if the truck is level. Leaning on one side can be a sign of a worn or broken spring. Check the passenger side of the truck as well as the driver's side. At the back of the tractor, make sure the tailights work and no lens cracks. Physically check each mud flap to make sure it is installed securely. View both the hydraulic and air line, which runs from the tractor to the trailer. Look for any signs of cracks or abnormal wear. Examine the exhaust. Make sure it's installed securely. Also look for any signs of holes or cracks. Start your internal checklist by getting over the engine. Listen for any knocking or any abnormal noises. Then adjust the seat and check the seat belt. Make sure all mirrors are adjusted correctly. Check electrical devices, including horns, and the dashboard lights. Look at each dashboard device and make sure that each of them is within its normal operating readings. Then check the air brakes. Repeatedly depress the brake pedal until the low-pressure buzzer sounds. Air. the time it takes for the pressure to reach an adequate level. Different systems have their own normal range. Make sure you are familiar with your air brake system. There are many different types of commercial trailers, and each one has its own unique features that need to be tested. Elements of the general service checklist include checking each tyre and wheel. Examine the air and hydraulic lines, look for any signs of wear or cracks. Make sure every light works properly. Check the mud flaps to make sure they are safe. Autumn is the perfect time to take care of the little things that can make a big difference to you and your home. Most of the tasks listed below are well-c-in-able ability of the average person. But even if you decide to have a professional handle on them, it's worth the cost. You will save money, and maybe even your life. We will walk through the cleaning of gutters, roofs, fireplaces and more. The drainage system of your roof annually diverts thousands of gallons of water from the exterior and foundation walls of your home. That's why it's so important that this system flows smoothly. Clogged gutters can cause damaged external surfaces and water in the basement. They are also more prone to rust and corrosion. Before the leaves fly this fall, your gutters are cleaned and then covered with mesh guards to keep the trash from returning. Related: How to care for gutters at home with leaks of air around windows and doors as the coat is left unbuttoned. Gaps in plugging and weather-stripping can account for 10 percent of your heating bills, according to the U.S. Department of Energy. Weather-stripping is easily the most cost-effective way to curb in heating and cooling costs. This humble material also reduces draughts and keeps your home more comfortable all year round. Since weather sweeps can deteriorate over time, it is important to check it periodically. If you suspect a problem with weather stripping, you have several options to check. Close the door or window on a strip of paper; if the paper slips easily, your weatherstripping doesn't do your job. Either close the door or window and hold a lit candle near the frame. (Don't let the flame get near anything flammable!) If the flame flickers anywhere along the frame, you have a leak of air. While you're at it, also check for missing or damaged plug-in around windows, doors and entry points for electrical, cable, phone, gas, and so. Print any gaps with a suitable plug. Related: More Fall Fix-Ups for Your Home A Few Homeowners Problem More Annoying Than Leaky Roof. Once the drips begin, finding the source of the problem can be time consuming. Stop the problems this fall before ice and winter turn them from trouble into distress. Start by inspecting the roof from top to bottom using binoculars if necessary. Check the shingles of the ridge for cracks and damaging winds. Look for metal metal damage in the valleys and around the vents and chimneys. Scan the entire roof for absence, curled up or damaged shingles. Look into the ditches for large clusters of pellets, a sign that your roof is losing its coverage; expect problems soon. Finally, make sure your gutters flow freely. Editor's Tip: Television antennas installed on the roof, even if not in use, can have the guy's wires holding them in place. Look for loose or missing guy wires. If you see some and your antenna is no longer in use, consider whether it is removed altogether. Related: Roof Repair Tips Every homeowner should know if you live in an area with frosty weather, take steps to ensure that outside faucets (also called windowsills) and underground irrigation systems don't freeze and burst. Close any switched off valves serving external faucets and then open the external faucet to drain the line. (There may be a small lid on the faucet you can loosen to ease this draining.) If you don't have switching off valves, and your faucets aren't freezing types, you can benefit from Styrofoam faucet covers sold in home centers. To freeze the terrestrial irrigation system, follow the manufacturer's procedure to drain it and protect against winter damage. Oven dust traps filters that would otherwise be deposited on furniture, woodworking, and so on. Clogged filters make it difficult to keep your home at a comfortable temperature, and can seriously increase your utility bills. A simple monthly cleaning is all it takes to keep these breath filters free and clear. Disposable filters can be vacuumed once before replacing. Foam filters can also be vacuumed, but they should not be replaced if they are not damaged. Use a soft brush on the vacuum cleaner. If the filter is metallic or electrostatic, remove and wash it with solid water spray. Once a year, it is a good idea to have your heating system checked by a professional. To avoid a last-minute rush, consider planning this task in early autumn, before the start of the heating season. Here are signs that you should have an inspection performed earlier: Noisy belts: Unusual screeching or whining can be a signal that belts connected to the engine blower are worn or damaged. Poor performance: A heating system that doesn't seem to work as well as it did in the first place can be a sign of various problems. Your heating channels may be blocked, the burners may be incorrectly adjusted, or the blower engine may be on the last legs. One check you need to be sure to hold: Make sure your oven filter is clean. Unsustainable Behavior: It Can caused by a faulty thermostat or an incorrectly adjusted furnace. Even if you use your fireplace only occasionally, you should check it annually for damages and hazards. View your chimney for Creosote: Creosote is a flammable burning wood product. If it accumulates in a chimney or chimney, the result can be a devastating fire. You have a chimney chimney annually to accumulate creosote. If you use a fireplace or wood-burning stove frequently, there is a chimney checked after each tree cord is burned. For most people, the best option is to have the entire chimney system checked the chimney sweep. Once you know what to look for, you can perform an inspection by beaming a bright flashlight up the chimney, looking at any sediment approaching 1/8 inch thick. These deposits must be cleaned by an experienced chimney. Look for fla fillings: Birds love to nest at the top of an unprotected chimney. The chimney cover can prevent this. If you don't have caps, look for the flu to make sure that there are no obstacles. Exercise Damper: A damper metal plate that opens and closes the flu just above the fire box. Move it to open and closed positions to make sure it works properly. Check the chimney for damage: make sure the chimney lid (screen or partition covering the top of the chimney) is in place. View the brick chimneys on loose or broken joints. If access is a problem, use binoculars. Related: Festive Autumn Mantel Ideas You may know that bone dry winter air is bad for your health, but do you also know it can make thin wood more prone to cracking? You and your home will feel more comfortable if you keep your central moisturiser in tip-top shape for months it works. First, inspect the plates or pads, and if necessary clean them in a strong solution of washing powder. Rinse and scrape mineral deposits with a wire brush or steel wool. Keeping the gas heater in good shape is both a matter of safety and cost. An incorrectly maintained heater can spew poisons into the air of your home, or it may just cost you more to work. Have a professional check of these devices annually. There are also some service items that you should address. First, turn off the heater. Then check the air shutter holes and exhaust holes for dirt and dust. If they are dirty, vacuum the airways to the burner and clean the burner of the lint and dirt. Follow the manufacturer's advice for any other service you need. Wood stoves are a great way to add atmosphere and warmth to your home. But regular checks are necessary to ensure that these devices do not become a security risk. Here's how to check them out. View Stovepipes: Cracks in stovepipes attached to wood-burning stoves can release toxic fumes into your home. Throughout the heating season, you should check for corrosion, holes, or loose joints. Clean the stove and then look for signs of deterioration or Replace the oven if necessary. Look for corrosion and cracks: Check for signs of rust or cracks in the body of the oven or foot. Check safety features: Make sure that any necessary wall protection is installed in accordance with the manufacturer's specifications and that the device is on the approved floor material. If If Have small children, be sure to fence off the stove when it is in operation. Damaged tracks, discs and steps are dangerous all year round, but their dangers are exacerbated when the weather becomes icy. Fixing problems in the fall is also crucial to prevent small problems from becoming expensive headaches. Look for cracks over 1/8 inch wide, uneven sections and loose railings on the steps. Check the decay of asphalt or blurred materials on loose tracks. Most small jobs are well within the possibilities of do-it-yourself, but keep an overhaul for experienced hands. At least once a year, do a top-down review of your home's security features. It's also a good time to get your family together to review your fire evacuation plan. Here's how to do it: Smoke detectors and CO: Replace the batteries in each smoke detector and carbon monoxide (CO), and then vacuum them with a soft brush mount. Check the detectors by pressing the test button or holding the source of smoke (such as a blown candle) near the device. If you haven't already, install a smoke detector on every floor of your home, including the basement. Fire extinguishers: Each home must have at least one fire extinguisher rated for all types of fires (look for an A-B-C rating on the label). At a minimum, keep it close to the kitchen; having one on the floor is not a bad idea. Check the light on the pressure sensor annually to make sure the fire extinguisher is charged. Make sure the lock pin is undamaged and firmly in place, and make sure the nozzle is not clogged. Clean the fire extinguisher and check it for dents, scratches and corrosion. Replace if the damage seems serious. Note: Fire extinguishers that are over six years old must be replaced. Mark the date of purchase on the new unit with a permanent marker. Fire escape plans: Each bedroom, including basement bedrooms, should have two ways out. Make sure the windows are not blocked by furniture or other items. Ideally, each upper-floor bedroom should have a rope ladder near the window for emergency exits. See what to do in the event of a fire, and arrange a safe meeting place for everyone away from home. General Cleanup: Rid your home with the accumulation of old newspapers and the residues of dangerous household chemicals. (Check with your state or local Environmental Protection Agency about the right way to eliminate dangerous chemicals.) Store flammable materials and poisons in approved, clearly marked containers. Keep a clean space around heaters, stoves and other heat appliances.
