Deliberately breaking with the classic biological description of marine organisms and their products, this reference emphasizes microbial technologies over basic biology, tearing it away from its predecessors. Thus, it systematically covers the technologies behind the high cost of compounds for use as pharmaceuticals, nutraceuticals or cosmetics, from exploration to manufacturing issues. Following the definition of this area, the book examines all the industrially important aspects of marine microbial biotechnology. The first main part contains descriptions of the main production organisms, from archeacteria to cyanobacteria to algae and symbionts, including their genetic engineering. The other four parts look at the commercially important compounds produced by these microorganisms along with their use. Throughout, the emphasis is on technological considerations, and the future potential of these organisms or complex classes is discussed. A valuable and promising resource for innovative biotechnology in industry as well as in academia.
